

PITCH — 5282.T — VERDICT: PROPOSED — PENDING ADJUDICATION (a prior court on None ruled BORDERLINE; that ruling is SUPERSEDED by the open court)

ADJUDICATED 2026-09-16 — WATCH — band ¥380 (conviction 7/10). The court found nothing to own at this price; the reopen gates below are the only path back.

What we believe

Geostr (5282.T) makes precast concrete segments — the pre-made concrete rings that line shield-driven tunnels — built to order against Japanese public infrastructure work. It is a ~¥13.2bn market-cap company on TSE Standard with no analyst price targets and, per one industry database, a Nippon Steel group subsidiary.

Four things we believe after both benches were done:

1. **The screen price is a lie in the bull direction.** The “7x earnings” you see comes from company-guided net income of ~¥1,904mn, which contains a ~¥1.3bn gain on selling cross-held shares. Strip it at a 30.6% tax rate and underlying earnings are ~¥1.0–1.04bn, EPS ~¥32–33, so the real multiple is **~12.7–13.0x, not 7x**, on a **~4.0% return on equity**. The company confirms this itself: the 2026-08-06 tanshin says in plain Japanese that the ~¥1.3bn sale gain is *not* being put into the dividend funding base (<https://www.geostr.co.jp/wp-content/uploads/f3d23611358d5bd95bd0a48153bdcccec.pdf>). A ¥10 dividend at ~31% payout back-solves to ~¥32 of clean EPS — the dividend arithmetic is the clean-earnings disclosure the P&L withholds.
2. **But the red bench’s “it’s already at fair value” is wrong.** Red built fair value (¥396–452) by capitalizing that ~3.9% ROE forever. That ROE is a company-declared trough — the firm guided H1 ordinary income to **zero** and the full year to ¥1,500mn (–28.7%) because large-segment orders are in a gap period, and the same filing says demand for large segment products recovers **from FY2028**. On mid-cycle earnings (ordinary ~¥1.73bn → ROE ~4.7%) fair value is ~¥505; on last year’s clean actual (ordinary ¥2,104mn → ROE ~5.6%) it is ~¥614. So the honest band is **¥505–615 vs ¥419, i.e. +20% to +47%**.
3. **The cheapness is real but small.** +20–47% at mid-cycle, on an asset with a two-year wait and no coverage, is not a table that clears our +50% bar at the midpoint. That is the whole verdict.
4. **The balance sheet, not the income statement, is where the option lives.** Equity ratio ~67.9%, debt roughly flat, ¥4.0bn of receivables released, and cross-held shares still on the book after a ¥1,574mn reduction — meaning the “windfall” is likely a **multi-year disposal**

program, not a single event, and it is explicitly earmarked “on the premise of” buybacks and capex.

What the market believes

The market believes two contradictory things at once, and that’s the interesting part.

- **The screen layer** (aggregators) believes this is a 0.52x-book, 7x-earnings, improving-profitability company. The Yahoo Japan page literally carries a machine-written summary saying sales keep rising year-on-year and profitability is somewhat strong **on the same page** as a –36.8% sales print with an operating loss. That is windfall-inflated data being narrated as a trend.
- **The people actually trading it** believe less. The stock is ¥419–425, ~17% below the ¥508 February high, and there are 1.21m shares of retail margin longs (≈3.8% of shares out, ≈16.5 days of average volume) with essentially zero short interest — a crowd that is long and stuck, not a coiled spring.
- **The street, where it exists:** IFIS consensus had FY3/26 ordinary at ¥1,650mn against a ¥2,104mn actual (+27.5% beat), and the FY3/27 company guide of ¥1,500mn came in **11.8% below** consensus. So the market’s number is ~¥1.70bn and the company deliberately guided under it. The market is not modeling a permanent trough; it is modeling a gap year with a soft recovery, which is close to where we are.

The gap between us and the market is therefore *narrow*, not wide — and that is the case against the trade.

Why we might have edge

- **Nobody publishes a clean EPS for this name.** With no broker targets, the only widely-visible earnings number is the guided one that contains the disposal gain. Anyone who does the ex-gain arithmetic knows something the screens don’t — but note that cuts *against* the stock, so the edge here is mostly in **not** buying a value trap.
- **The recovery date is in the filing and almost nobody reads it.** The issuer dates large-segment demand recovery to FY2028+. That means the November H1 print is nearly information-free and the **FY3/28 guidance in May 2027** is the real repricing event. Both benches initially set tripwires on the wrong date; we now have the right one.
- **The disposal program is probably recurring.** Cross-held shares remain on the balance sheet. If Japan’s ongoing corporate-governance pressure keeps forcing unwinds, there are more gains coming, and the company has already said in writing they’re earmarked “on the premise of” buybacks. A real buyback resolution on a ¥13.2bn cap with 67.9% equity ratio is a genuinely large lever.
- **A parent tail exists.** If Nippon Steel really is a majority holder, the group has an incentive at some point to buy in a small listed subsidiary; historical Japanese take-private prices cluster around 0.7–0.9x book, which here is **¥565–727**.

Why it might be priced in

- **0.52x book is the normal price for a 4% ROE.** At a 7.5% cost of equity, warranted price-to-book is $\sim 0.52x \rightarrow \sim ¥420$. That is literally the tape. Red's error was capitalizing the trough forever; but if the trough *is* the through-cycle reality, red is simply right and the stock is exactly where it should be.
- **The bad news was pre-announced.** The Q1 operating loss of ¥146mn was not a surprise: the company guided interim ordinary income to zero back in May. A pre-guided loss doesn't create a dislocation, and the stock has already traded down $\sim 17\%$ from February without breaking.
- **The buyback is not a buyback.** The filing says "on the premise of" acquiring treasury shares **or** business expansion **or** capital expenditure. There is no board resolution, no yen amount, no share cap. Simultaneously the cash was ring-fenced *out* of the dividend base. Read coldly, shareholders were told the money is not theirs yet.
- **There is nothing to squeeze.** Zero short base, 16.5 days of leveraged retail length overhead. Any rally into ¥450–470 meets sellers who have been underwater since February.
- **The cheapness is 20–47%, not 100%.** Even the bull path needs ROE $\sim 6.2\%$ to reach +50% (¥630), which this company has not printed without selling shareholdings.

What could go wrong (PRE-MORTEM, v1.7)

Failure narrative #1 — the gap year isn't a gap, it's the new level (monitorable). Large-segment tunnel awards don't come back in FY2028; the -36.8% quarter turns out to be share loss or price competition dressed up as order timing. Mid-cycle ordinary of ¥1.73bn never appears, ROE stays $\sim 4\%$, and fair value really is ¥400–450. We bought at ¥380–419 and dead-money for three years while the dividend pays us 2.4%. *Tripwire:* FY3/28 guide (May 2027) ordinary below ¥1.5bn, or Japanese public-procurement award registries (MLIT / NEXCO / JRTT / prefectural bid results) showing segment-category award volumes flat-to-up while Geostr's revenue falls. **This one is checkable and we will check it.**

Failure narrative #2 — the parent is the risk, not the prize (NO MONITORABLE TRIPWIRE).

We have *no* verified ownership figure. One industry database calls it a Nippon Steel subsidiary; we could not fetch the filing that states the stake. If the parent relationship is real, the parent controls what happens to ¥1.3bn of cash, the treasury-share "premise," transfer pricing on group work, and the timing and price of any buy-in. A parent can also simply decide the listed sub should retain cash for a group capex program, or take it out at 0.6x book instead of 0.9x. **There is no sensor for a parent's intent.** Ownership tables update annually; board discussions never appear until the press release, which is typically issued after a trading halt at a price we did not negotiate.

*Unknown-unknown class: **principal-agent / controlling-shareholder discretion risk** — a second decision-maker whose objective function is not shareholder value at this entity, whose actions are unobservable until they are irreversible.* We cannot instrument this; we can only size for it.

(Related, equally uninstrumented sub-class: **disclosure-regime opacity** — the items we need most, backlog and net cash detail, are simply not published quarterly in this market.)

Failure narrative #3 — we get the science of the earnings right and the arithmetic of the exit wrong (reflexive / structural leg). Average daily volume is ~73,300 shares ≈ **¥31mn a day**. That is the binding constraint on everything. - A 0.5%-of-book starter sized at ¥15mn is already **~0.5 days of ADV**; our stated maximum of ¥46mn is **1.5 days**, and getting out of that in a falling tape at a disciplined $\leq 15\%$ of daily volume takes **~10 sessions**. In a -10% week we will not be the first seller. - Above us sit **1.21m shares of retail margin longs — 16.5 days of ADV**, with zero short interest. Predicted flow on any good news: margin holders who have been trapped since ¥508 sell into strength. Our buying pressure meets their supply; our selling pressure meets nothing. The order book is asymmetric against us in both directions. - **Doctrine interactions:** three of our house rules collide here. (a) The *windfall-masked-flat-guide* detector says sell/avoid; (b) the *trough-year warranted-PBR artifact* mechanism says red's kill was an input error and the name is cheap; (c) the *guided-zero interim bar* detector says the November print cannot resolve either one. Net effect: our own framework says "cheap, but you cannot learn anything for eight months." A position taken on (b) while (c) is true is a position with no feedback loop — we will be tempted to add on noise, and the illiquidity means every add is permanent. That is exactly how a 0.5% watch position becomes a 2% mistake.

If this position loses money, the most likely reason will be that we bought a real but small discount (+20–47%) in an illiquid, uncovered, parent-controlled name where the only information event is eight months away — and then either the FY2028 order recovery the company promised didn't arrive, or it did and the 16 days of trapped retail length above us absorbed the entire re-rating before we could exit a position we couldn't sell in less than ten sessions.

What we checked ourselves

Claim	How checked	Found	Confirmed?
Pack tape px 402.0	Live quote rails: Yahoo! Finance JP realtime, Matsui 09/08, Nikkei 最低購入金額 ¥42,300	¥419 realtime / ¥423 (09/08) / ¥425 close (09/04) — pack is stale by 4–6%	NO — pack superseded
The trigger condition ("touched ¥400")	Same rails	Band lapsed; tape is 4–6% above it	REFUTED — condition gone
Pack 52-week low 325	Red said the low is ¥360 (2026-06-04)	RED BENCH ERROR. ¥360 is the calendar-YTD low (年初来 = year-to-date, not 52-week); the stock printed ¥307–308 in Aug/Sep 2025. Pack's 325 stands, and the stock is ~+29% off the true 52w low — i.e. <i>worse</i> for entry than red claimed	Pack confirmed; red's basis wrong, conclusion accidentally right
P/E ~7x	Rebuilt from cap structure: 31,530,000 shares, EPS guide ¥60.39, BPS ¥807.80; stripped ¥1.3bn gain at 30.6% tax	Ex-gain net ~¥1.0–1.04bn, EPS ¥32–33, P/E ~12.7–13.0x , ROE ~4.0%	REFUTED (the 7x); the 13x is CONFIRMED, cross-tied two ways

Claim	How checked	Found	Confirmed?
Ex-gain EPS cross-check	(Guided ordinary ¥1,500mn + ¥1,300mn gain) × 0.68 = ¥1,904mn — ties to the guided net to the yen	Arithmetic ties; ex-gain net ¥1,041mn	CONFIRMED
Second independent cross-check	Primary tanshin 2026-08-06: gain explicitly excluded from the dividend funding base; ¥10 DPS ÷ ~31% payout	Implies clean EPS ~¥32 — matches	CONFIRMED (primary source)
“Fair value ≈ tape, ¥396–452, no margin of safety”	Recomputed with mid-cycle instead of guided-trough ROE	RED BENCH ERROR. Trough ROE capitalized in perpetuity; FY3/26 actual ordinary was ¥2,104mn (+33.2%) and the issuer dates recovery to FY2028. Corrected FV ¥505–615	OVERTURNED
“Flat headline masks a collapse”	IFIS 決算速報, 2026-05-15	The company pre-guided H1 ordinary to zero and the FY guide came 11.8% <i>below</i> consensus. The Q1 loss was pre-announced, not concealed	REDUCED — not a mask
“Buyback = governance improvement”	Primary tanshin text	Operative words are “on the premise of” treasury-share purchase or expansion or capex. No TDnet resolution exists. Cash simultaneously withheld from the dividend base	REFUTED as a shareholder-return event
Brief’s “¥6 vs ¥11 dividend step-down”	Yahoo JP dividend page	OUR OWN BRIEF was right and RED WAS WRONG to kill it: FY3/26 is ¥6 (3+3), down from ¥11 (3+8); red compared it to the FY3/27 ¥10 guide — a period mismatch. Also ¥6→¥10 is a 67% raise in a trough year , a bull datapoint red inverted	Brief CONFIRMED; red’s kill OVERTURNED
“No street number exists to diverge from”	IFIS consensus wire	RED BENCH ERROR. Consensus exists (FY3/26 ordinary ¥1,650mn vs ¥2,104mn actual; FY3/27 guide 11.8% below street ≈¥1,700mn). Red counted a login-gated page as an orphan	OVERTURNED
Aggregator summary reliability	Same Yahoo JP page as the –36.8% print	Page asserts rising sales and “somewhat strong” profitability on top of an operating loss — confirmed contradiction. But red’s claim that our screen ingested the inflated ROE/PER is unevicenced: the screen row was a price band and carried no metrics	Contradiction CONFIRMED; red’s causal claim REDUCED to hygiene note

Claim	How checked	Found	Confirmed?
Margin-long overhang	Arithmetic on 信用買残 1,207,700 sh vs 31.53m shares out and 73,300 ADV	3.8% of shares, 16.5 days ADV, ~zero short interest. Blue's search budget ran out before re-pulling the source rail	Arithmetic CONFIRMED; source PLAUSIBLE, not re- verified
Catalyst date	Company IR library; prior- year cadence 2025-11-07	H1 print ~2026-11-06 (unconfirmed — no company PR), but the issuer's own recovery date is FY2028 ⇒ the binding print is the FY3/28 guide, ~May 2027 . Both benches originally set tripwires on the wrong date	Both benches erred; corrected
Ramp/dump, lockup, EGC- exemption, Up-C/TRA, dividend-recap, common- control detectors	Dispatched detector set	All NOT-FIRED or inapplicable. Note: the two benches ran different detector lists — red substituted seven undispatched US-geographic connectors (Albuquerque/Austin/Bozeman permits, FEMA NRI, Laserfiche, snowpack, restaurant ratings) that could never fire on a Japanese precast maker	Clean, but dispatch hygiene failed

PROPOSED ENTRY BANDS

The courts say NO ENTRY. Below are the reopen bands. Immediate action today: none. Book stays flat.

Price reopen ladder (all levels from the benches' own math):

Level	Basis	Action if hit
¥380	0.47x book; EV vs table = +25.5%	Reopen the court. Starter 0.5% of book , max ¥15mn ≈ 36,000 sh ≈ 0.5 days ADV
¥360	2026 YTD low (2026-06-04); a level that already held once	First add, +0.5% of book. Cumulative cap 1.0%
¥325–330	Pack 52w low / ~0.40x book	Second add to full size 1.5% of book (¥46mn ≈ 110,000 sh ≈ 1.5 days ADV) — only if narrative #1's tripwire has <i>not</i> fired
below ¥307	Breaks the Aug-2025 true 52w low	Thesis break, not a bargain. Exit any position; the trough is structural

Event reopens (price-independent) — any one of these re-courts the name at any price up to ¥470: 1. A TDnet **treasury-share purchase resolution** with a yen amount and share cap, sized **≥5% of the ¥13.2bn cap (≥¥660mn)**. Not “on the premise of” language — an actual board

resolution. 2. H1 FY3/27 ordinary income **>¥0** against the company-guided zero, **accompanied by a disclosed order-backlog figure**. The backlog is the load-bearing half; a beat on a zero bar alone is worth nothing. 3. **FY3/28 guidance ordinary income ≥¥2.0bn** (May 2027). This is the real one. 4. The June 2027 annual securities report disclosing (a) the Nippon Steel stake, (b) remaining cross-held shares, (c) a numeric ROE target in a capital-cost/PBR improvement plan.

Trims and exits, if ever filled: - Trim **half at ¥505** (mid-cycle fair value — our own base case; do not be greedy in a 16-day-ADV overhang). - Exit remainder **¥600–615** (clean-year fair value). Above that we are paying for a take-private tail we cannot verify. - **Hard exit regardless of price:** FY3/28 guide ordinary <¥1.5bn, or the company pushes the recovery date past FY2029. - **Execution rule:** never more than 15% of that day's volume, scale over ≥5 sessions, limit orders only. Assume a 10-session exit.

Catalyst dates: ~2026-11-06 H1 tanshin (UNCONFIRMED — no company PR names it; ±1 week); ~2027-02-05 Q3 (inferred); **~2027-05-14 FY3/26 results + FY3/28 guidance — the binding print**; ~2027-06-25 annual securities report (ownership, cross-holdings, governance plan).

ARMED SENSORS

(armed provisionally with this deck; session adjudication ratifies)

- price alert: fires below 307.0 (deck-provisional: true Aug-2025 52w low; breaking it means the trough is structural - exit, do not add)
- dated pack 5282.TI2026-11-06: 5282.T: H1 FY3/27 tanshin (reconstructed from prior-year 2025-11-07 cadence); bar is a company-guided zero so only a disclosed backlog figur
- dated pack 5282.TI2027-02-05: 5282.T: Q3 FY3/27 tanshin (inferred from cadence) (date confirmed=False)
- dated pack 5282.TI2027-05-14: 5282.T: FY3/26 results plus FY3/28 guidance - the binding resolver, since the issuer dates large-segment recovery to FY2028+ (date confirmed)
- dated pack 5282.TI2027-06-25: 5282.T: annual securities report: ownership, cross-holdings, net debt, governance/PBR plan (date confirmed=False)

What remains unverified

1. **Nippon Steel's actual stake and whether 5282 is a controlling-shareholder subsidiary.** Red asserted ">50% subsidiary" from a one-line database description while flagging the % as its own gap — then leaned on it for float math. Not drainable now. Estimate: **40–60% held by Nippon Steel, point estimate ~50%**, from the base rate of Nippon Steel's other listed group affiliates; p(majority control) ≈ 0.6.
2. **Net cash / interest-bearing debt in yen.** We know equity ratio ~67.9% and that debt is "flat," but no yen figure. Estimate: **net cash ¥2–5bn (15–38% of the ¥13.2bn cap)**, from the equity ratio plus the ¥4.0bn receivables release; p ≈ 0.65 that the company is net cash.
3. **Order backlog (受注残高).** The entire "gap period, recovers FY2028" story rests on this and it is not disclosed quarterly. Not drainable now. Estimate: **¥8–14bn (roughly 0.35–0.55x annual sales)**, from Japanese build-to-order civil-engineering peer base rates.

4. **Remaining cross-held securities on the balance sheet.** Determines whether the ¥1.3bn gain is a one-off or a multi-year program. Estimate: **¥1.5–4bn remaining after the ¥1,574mn reduction**, i.e. 1–3 more years of similar gains; $p(\text{another gain} \geq ¥500\text{mn within 24 months}) \approx 0.5$.
5. **Whether a treasury-share purchase resolution actually comes.** Pure intent language today. Estimate: **$p \approx 0.35$ within 18 months**, from the base rate of Japanese issuers converting “on the premise of buyback” language into a resolution.
6. **Direction of the 2026-03-27 dividend-revision notice.** Draggable now from the TDnet archive; we simply have not pulled it. Working assumption: a raise, consistent with the ¥6 → ¥10 path.
7. **Confirmed H1 print date.** Reconstructed ~2026-11-06 from prior-year cadence. Draggable once the company posts its results-date notice. Estimate: 2026-11-06 ± 7 days, $p \approx 0.8$.
8. **Current margin balance.** The 1,207,700-share figure is as of 2026-08-28 and was not re-verified. Draggable now from the JPX weekly rail. Estimate: 1.1–1.4m shares, $p \approx 0.7$.

PRIZE TABLE + VOL READ

Anchor: the tape at **¥419**. Adjust from there, not from our own fair-value estimate.

Scenario	What happens	p	Price
Structural trough	FY2028 recovery slips; ROE stays ~4%; margin longs capitulate	0.20	¥360
Dead money	Red's world: fair value = tape; nothing resolves; we collect 2.4%	0.30	¥420
Mid-cycle	Ordinary returns to ~¥1.73bn, ROE 4.7%, PBR 0.63x	0.28	¥505
Clean-year	FY3/26-clean earnings repeat, ROE 5.7%, PBR 0.76x, plus a real buyback	0.15	¥614
Parent buy-in	Take-private at 0.7–0.9x book	0.07	¥650

EV = ¥477.0 → +13.8% vs ¥419. At the ¥380 reopen band, EV = **+25.5%**. Neither clears +50% at the midpoint; the ¥380 entry is what makes the ladder defensible at all. **Table dispersion $\sigma_{\text{table}} = ¥94.0 = 22.4\%$ of spot**, over $T \approx 0.67y$ to the May-2027 resolver $\Rightarrow$ **annualized $\approx 27.4\%$** .

Vol read — and the instrument arithmetic: There is **no listed options chain on 5282.T**. TSE single-stock options cover only the large-cap universe; a ¥13.2bn Standard-market name with ¥31mn of daily turnover has none, and there is no OTC market we can access at a spread worth paying. So the “chain-level midpoint IV vs candidate strikes” test cannot be run on real quotes — and we are explicitly **not** substituting an aggregate/underlying IV feed for it (the TSSI 71-vs-101 lesson: those feeds diverge from real chain midpoints and using one would fabricate an answer).

We ran the expression math anyway so the absence is priced, not waved away. From the table itself, $C_{\text{ours}} = \sum p_i \times \max(S_i - K, 0)$: - $K = ¥400 \rightarrow ¥85.0$ (20.3% of spot) - $K = ¥450 \rightarrow ¥54.0$ (12.9% of spot) - $K = ¥500 \rightarrow ¥29.0$ (6.9% of spot)

Proxy RV, since we have no options tape: Parkinson from the 52-week range (¥325–508) gives **≈26.9% annualized**. Against σ_{table} -annualized of **27.4%**, the implied VRP is **≈ +0.5 vol points — effectively zero**. Translation: even if a chain existed at fair value, our own scenario dispersion is indistinguishable from realized vol, so there would be **no volatility edge in either direction** — no cheap convexity to buy, no rich premium to sell. The table is also mildly **bimodal/fork-dated** (a ¥360-vs-¥505+ fork that resolves on a single May-2027 date), which would make at-the-money premium selling the worst of the available choices.

Instrument recommendation, as the output of the above: STOCK ONLY, and today NONE. No chain $\Rightarrow$ no calls, no covered calls, no cash-secured puts. Long stock is the only expression, and at ¥419 with +13.8% EV it does not earn the illiquidity. At ¥380 (+25.5% EV) it does, at starter size.

Tax overlay: with no options, there is no expiry to manage — but the same rule binds the stock. The loss branch of this table (the ¥360 scenario) resolves on the **May-2027 FY3/28 guide**, which is past Dec 31. A position opened now **cannot** deliver a harvestable loss in the current tax year. If this is a harvest year, that disqualifies the entry on its own unless the edge numerically dominates — and +13.8% EV against a 20% probability of a –14% outcome does **not** dominate. **Excluded during harvest years. Reconsider at ¥380, in January, or on an event reopen.**
