

Baccarat Rogue

The scent lingers after the money's left the room.

THE TRADE IN ONE PARAGRAPH

For the five weeks of the 2026 World Cup (June 11 – July 19)^[1], the world's table-gambling wallet left the casino floor. Macau gross gaming revenue fell 12.1% year-over-year in June^[2] and 8.4% in July^[3]; Las Vegas Strip baccarat volume fell ~22% in June while ex-baccarat play grew^[4]; Pennsylvania table games fell 21% while its slot revenue was roughly flat^[5]. Slots held everywhere; tables emptied everywhere; and jurisdictions that count online betting showed the money arriving there instead^[6]. The tournament ended July 19 and Macau's daily revenue run-rate inflected upward that same week and has climbed since^[7]. The market, reading luck-distorted operator headlines, treated part of a dated diversion as structural decline^[8]. **The position: dated, defined-risk WYNN call spreads bought at the cheapest implied volatility of the year^[9], sized so total failure costs ~40bps of book after tax, graded against a public-statistics calendar that culminates September 1.**

EXHIBIT 1 — THE DRAIN: ONE WALLET, THREE REGULATORS, SAME MONTH (JUNE 2026, Y/Y)

Venue	Slots / retained cohort	Tables / diverted cohort	Source
Las Vegas Strip	ex-baccarat +2.1%	baccarat drop –22.4%	Nevada GCB June revenue report ^[4]
New Jersey	+1.7%	–6.4% (total incl. online: +7.9%)	NJ DGE June press release ^[6]
Pennsylvania	–1.3%	–21.0%	PGCB June revenue report ^[5]
Macau	visitor arrivals +4.0%	GGR –12.1%	DSEC arrivals; DICJ monthly ^{[2][10]}

The split identifies the mechanism. The slot-floor demographic stayed put in every jurisdiction; the table demographic — younger, bet-inclined, the sports-betting overlap — went missing in every jurisdiction at once. Macau's visitors kept arriving (+4.0%); their gambling spend went elsewhere. New Jersey, the one U.S. state whose regulator publishes retail and online in one release, shows the wallet conserved: floor down, total up 7.9%^[6].

EXHIBIT 2 — WHERE THE WALLET WENT, MEASURED

- **Flutter:** 180 million tournament bets; sportsbook handle +174%, tournament revenue +164% — the company's own Q2 release^[11]. *Bought with promos; the point is the volume existed.*
- **Underground Chinese books:** a multi-province police enforcement campaign against World Cup betting rings ran through the tournament, per Chinese state-media and police reporting compiled in the thesis file^[12]. *National enforcement is not mobilized against a thing that is not happening.*
- **Hong Kong Jockey Club:** the one legal Asian football-betting channel; its fiscal year closed June 30, mid-tournament, and reports this month^[13]. *The quantified Asian datum arrives on its own schedule.*
- **The couch:** matches ran 3–9am China time for five weeks. Some of the wallet only watched. *Reverts on the same date as the betting.*

"my own gambling was diverted to world cup."

— THE PRINCIPAL. N=1, BUT IT WAS OUR N.

EXHIBIT 3 — THE REVERSAL, ALREADY ON THE TAPE

Timing discriminates cause. The enforcement campaign continued past the tournament; the tournament did not. Macau's recovery dates to the final whistle: Citi's channel check recorded daily revenue **+9% week-over-week in the exact week the final was played**^[7], and J.P. Morgan's August checks show the daily rate climbing from ~MOP710M to ~MOP793M with VIP and mass volumes both +10–15% y/y^[14]. July's full month still printed –8.4%^[3] — the month averages over the inflection, which is why the market's monthly instruments lag the weekly fingerprint. Consensus for August sits at ~+1.3% y/y (CLSA)^[15]; Jefferies frames August as the start of the recovery^[16]; our frozen call is $p = 0.72$ that August beats that bar, graded September 1 against the DICJ release^[17].

EXHIBIT 4 — WHAT FIVE ADVERSARIAL COURTS DID TO THIS THESIS

Every operator went through a red-bench/blue-bench court (prosecution and defense, no shared notes; artifacts on file)^[18]. Two results shaped the position:

1. Every operator's growth headline this cycle was flattered by elevated table hold — and it was not luck.

Wynn Palace printed mass-table hold of 29.7% vs 22.3% a year earlier^[19]; Galaxy and Studio City printed above their own disclosed normal ranges^[21]. Quarterly hold deviations, if they were card luck, would be independent across operators — the chance of three-plus printing elevated simultaneously is under ~1%^[22]. What actually raised hold is the thesis seen from the other side of the fraction: **(a) composition** — the cohort that left for the World Cup is the *low-hold* clientele (large main-bet baccarat at ~1.1% house edge, few side bets), so its absence mechanically raised the blended win rate on the volume that remained; **(b) structure** — engineered game and room mix (side bets at 5–15% edges, premium-mass rooms) raises hold where it is deployed, permanently. Headline GGR is $win = volume \times hold$, so the same diversion that emptied the tables dressed the survivors' win rates up as "growth" — the courts restated every claim in volume terms before believing it, and underlying premium volume ran weaker than every headline. That is why no cash equity cleared a conviction bar and the expression moved to dated options. Sands is the exception that proves the mechanism: drop +15% but EBITDA –24% on 1.35% VIP hold — the one operator whose *luck* genuinely ran bad while its volume recovered^[20].

2. The model that says which is which: 607 property-quarters across 18 series from primary filings^[22].

Fitted findings: there is **no cohort-wide hold elevation** (cohort $z +0.10$; six of twelve Macau series sit below their own trends) — the elevation is concentrated exactly where the mechanisms are. **Wynn Palace sits +11 σ above trend** — card luck cannot do that; the identified driver is a new room with different clientele: the Chairman's Club premium-mass expansion, tripled to ~100,000 sq ft in February 2026^[23], importing the highest-recycle players on the highest-edge mix into the mass math. Around it: slow structural hold drift at MGM (+1.36pp/yr — which quietly deleted its old 16–22% guidance range while running 25–27%) and Galaxy (+1.18pp/yr), corroborated by a decade of Nevada baccarat hold drifting +0.36pp/yr^{[4][22]}. The Street's framing of the Q2 beat was "beats on Macau *hold*" — a low-quality-beat discount, normalized away in hold-adjusted models — yet consensus price targets are constructive (avg ~\$134 vs a ~\$105 tape, 19 analysts, targets raised post-print)^[35]. The residual skeptics are the tape and, most precisely, the options market^[9]. If the Palace elevation is furniture, the Q3 prints meet it as run-rate. One honesty note our own model forced: the hold split is *not* visible in any monthly print — monthly GGR is $win = volume \times hold$, conflated — so the composition leg is confirmed at the Q3 filings (November), with weekly bank checks as a noisy interim proxy. September 1 grades the volume thesis; the furniture question resolves at the prints^{[17][22]}.

"how is it a catalyst if no one cares?"

— THE PRINCIPAL. THE ONLY QUESTION THAT MATTERS.

First, the exposure is not a side bet: Wynn Palace + Wynn Macau were **\$1,004.5M of WYNN's \$1,860M Q2 operating revenue** — **54%** — and \$297.0M of \$568.3M property EBITDAR — **52%**^[19]. A Macau revenue swing moves more than half the company's earnings power, and it reaches the equity through the parent's leverage. And the tape confirms the market prices it: on June 1, a good May DICJ print (+6.7%)^[24] moved WYNN +5.25% in one session^[25]. The market reacts violently to the monthly surprise and gradually to the weekly checks — the June de-rate happened *ahead* of the bad print via the same channel checks now running positive^{[7][14]}. The edge is calendared, and it decays: you buy before the Mondays run out.

EXHIBIT 5 — THE POSITION (FILLED 8/11, LIVE BASIS)

Leg	Basis	Structure & intent
WYNN Oct 16 '26 105/115 call spreads (filled)	≈ 38 bps of book at risk	The gate trade: spans the weekly checks, Sept 1, and Golden Week; expires <i>before</i> WYNN's Q3 print. Filled at roughly a third of the spread's width — ~3.1× on a full wallet-return, ≈ +80 bps of book net at max ^[26] .
WYNN Jun 17 '27 110/140 call spreads (filled)	≈ 25 bps of book at risk	Same thesis, slow lane — ~3.6× at max — plus optionality on the Palace expansion ramp and the UAE opening (first Gulf casino, 2027) ^[27] .
WYNN Nov 20 '26 105/120 call spreads (resting)	≤ 13 bps of book at risk	Deliberately rides the Q3 print — the branch where the analysts meet the furniture. Conditional tranche; fills only on our limit (capped at ~30% of width).
Max loss, all legs, after tax	~40bps of book	~76bps gross; losses net against realized gains at ~50% marginal — defined-risk debits ratified as outside the desk's no-premium-selling rule ^[28] .

Why the vol was cheap: at purchase, WYNN October implied vol was 30.7% against 34.4% realized — the 0th percentile of the trailing six months — because October is the no-earnings window and overwriter supply prices it as quiet^[9]. The option market schedules nothing before Oct 16. Our file schedules four Monday channel checks, a September 1 revenue print, and Golden Week. One side is wrong about what October knows; it cost about a third of the spread's width to find out.

EXHIBIT 6 — THE HONEST LEDGER: FOR AND AGAINST

For	Against
Decomposition discipline: five courts caught five hold-flattered headlines the market currently trades on ^[18] .	The channel checks are public and syndicated within days; operators are already 10–17% off their lows — part of the recovery is priced every Monday ^{[7][14]} .
Cross-venue triangulation: Macau GGR × Vegas baccarat × state table/slot splits × sportsbook handle as one conserved wallet — assembled here from primary regulator data ^{[2]–[6][11]} .	June's –12.1% exceeds any historical World Cup drag (~3–5pp), so residual genuine softness is plausible; Morgan Stanley's cut to "weak growth through Q4" may be partly right ^[8] .
Weekly resolution vs monthly verdict instruments: the inflection was visible a month before September 1 makes it official ^[7] .	Some June weakness may be enforcement chilling payment rails, which has no final whistle ^[12] . Ruled-in counterpoint: the rail-dependent junket cohort was already destroyed in 2021 and that demand rerouted to Singapore rather than vanishing ^[29] .

Calibration, stated plainly: the desk's graded record on operations-data calls is 89% hit rate, Brier 0.126^[17] — and the Sept-1 call is that kind of call. Our record on predicting the *tape's reaction* is two data points long. That is why the trade is small, and why it is the founding position of a pre-registered event-options sleeve that grades every such structure against both SPY-same-window and the un-optioned stock; the structure skill claim earns belief at $n \geq 10$, not before^[30].

EXHIBIT 6B — THE SINGAPORE QUESTION: DID THE MONEY LEAVE FOR GOOD?

The strongest version of the bear case is not Q4 softness — it is the 2021 precedent: when China abolished the junkets, the premium wallet did not die, it *permanently relocated* to Singapore and Manila, and Marina Bay Sands printed record years^[29]. If this summer's diversion resolves the same way, the recovery happens somewhere our spreads don't reach. We checked both sides against the drain quarter itself:

The wallet relocated (bear)	The wallet paused (our read)
2021 proves this cohort <i>can</i> leave for good when pushed, and the receiving infrastructure is still there — MBS broke ground on an \$8B expansion in 2025 ^[33] .	Singapore's own Q2 refutes the relocation for this episode: MBS net revenue was flat (−0.6%, \$1,380M vs \$1,388M) and EBITDA fell 10.3% in April–June — the exact drain window^[20]. A wallet arriving in Singapore would print as a surge; none appears.
China's enforcement wave has no final whistle — if part of June's −12.1% was payment-rail chill rather than the tournament, that fraction does not auto-revert ^[12] .	The drain appeared <i>simultaneously</i> in Vegas, Pennsylvania, New Jersey, and Macau ^{[4][5][6][2]} — a synchronized global table-cohort event timed to a scheduled tournament, not a Macau-specific exit. Nothing about Singapore explains Pennsylvania.
2027 adds new supply (Wynn Al Marjan, the first Gulf casino ^[27]) that could siphon premium demand structurally.	Macau arrivals ran +4.0% through the drain ^[10] — the bodies kept coming; only spend paused. And the money is already observably returning <i>to Macau</i> : +9% w/w at the final whistle, daily rates climbing since ^{[7][14]} . Relocation is a hypothesis; the return is on the tape.

Where we land, honestly: the 2021 mechanism was the destruction of a credit rail; 2026 was a scheduled event with an end date — different physics, and the MBS non-surge is the closest thing to a controlled experiment the quarter offers. But the bear's residual is real: June's −12.1% exceeds any historical World Cup drag (~3–5pp), so some fraction may be enforcement chill that doesn't revert — which is precisely what the September 1 gate exists to price, and what the kill rule below hands back if the print misses. We believe the return case *because* it is the one that can be falsified on a date.

EXHIBIT 6C — THE SEASONALITY AUDIT: IS AUGUST THE WRONG MONTH TO BET ON?

Asked and checked, because August Macau is genuinely unpleasant — heat, humidity, peak typhoon season. The short answer: the gate is seasonality-proof by construction, and the audit marginally *strengthens* it. The September 1 read is August-2026 **versus August-2025** — same school-holiday peak, same heat — so the seasonal shape nets out; and despite the weather, August is one of Macau's strongest months, because mainland summer school holidays drive family visitation^[3]. The market's monthly consensus is built off daily run-rates, so the seasonal shape is well priced — our claimed edge was never "the market can't do seasonality"; it is the recovery slope *within* the month. Three grading facts the audit put on the record:

Fact	Consequence for the gate
The comp base is a record : August 2025 printed MOP22.16bn, then the strongest post-pandemic month ^[34] . The +1.3% bar (~MOP22.4bn) sits on top of it.	A PASS is highly informative — recovery clearing a record base is the strong form of the thesis. A marginal miss against a record base is weak disconfirmation.
Calendar drag : August 2025 had five Fridays; August 2026 has four — one Friday swapped for a Monday, worth roughly half a point of monthly GGR (desk computation).	A print at +0.8% to +1.3% is a calendar-confounded near-miss and is graded with that noted — not waved through, not counted as a clean kill.
Typhoon tail : August–September is peak season; a signal-8+ storm closing floors or bridges shaves the month for reasons that say nothing about the wallet.	Weather shows up in <i>arrivals</i> , so the spend-per-visitor read survives a storm — but arrivals publish ~3 weeks after the GGR print, so a weather-contaminated September 1 verdict defers to ~September 22 , it does not resolve same-day. Filed in the pack as an amendment.

All three are annotations in the resolution pack, filed before the print. The 0.72 stays frozen — annotate, never re-strike.

EXHIBIT 7 — THE FALSIFIER CALENDAR: EVERY CLAIM HAS A DATE

Date	What prints	What it grades
this week	PA + NJ July revenue; HKJC annual results ^{[5][6][13]}	Do the domestic tables come home first; the Asian legal-betting surge, quantified
Aug 12	Galaxy interims ^[21]	Dividend/volume gates from its court
Aug 13	Studio City Q2 (confirmed) ^[31] ; Melco Q2 (confirmed) ^[32] ; Entain interims	MSC three-condition gate (volume ≥ \$958M, hold ≤ 34.5%, EBITDA ≥ \$76M); the pledge-coverage tail; surge-side hangover read
Mondays	JPM/Citi daily-rate checks ^[14]	A fade = do-not-add + review; annotate, never re-strike
Sept 1	DICJ August GGR vs the +1.3% bar — set against a record MOP22.16bn Aug-25 base, so a pass is highly informative ^{[15][17]}	The frozen call grades on the LEVEL — this is the gambling print (DICJ publishes GGR on the 1st). No appeals. The two confirming reads arrive later, below.
~Sep 22	DSEC August visitor arrivals (the tourism print — it lags GGR by ~3 weeks) ^[10]	Spend-per-visitor: recovery on ~flat arrivals = the wallet returned, not a tourism wave — the thesis's unique signature. Also the typhoon-fallback read: a weather-contaminated Sept 1 verdict defers here.
Oct 1–7	Golden Week	First clean seasonal pulse of the recovered regime
Nov	Q3 prints	Luck-deduction models meet the Chairman's Club run-rate

HOW THE VERDICT ACTUALLY ARRIVES — THREE INSTALLMENTS, NOT ONE

A correction worth showing the work on, caught in review before the print: the deck originally promised three reads on September 1. Only one exists that day. The gambling number (DICJ GGR) publishes on the 1st; the tourism number (DSEC arrivals) lags it by ~3 weeks; and the hold split appears in no monthly print at all — monthly GGR is win = volume × hold, conflated, the exact error our own courts prosecute. So the grading arrives staged, and each installment answers a different question:

Installment	What it answers	What can go wrong with the read
Sept 1 — the level (DICJ August GGR vs +1.3%)	Did the money come back at all? The frozen 0.72 grades here, and only here. No appeals.	Typhoon contamination → verdict defers to installment two. Calendar drag (one fewer Friday) makes +0.8–1.3% a fuzzy near-miss.
~Sept 22 — spend-per-visitor (Aug GGR ÷ DSEC Aug arrivals)	Did the <i>wallet</i> come back, or just bodies? Recovery on ~flat arrivals is the one signature a tourism wave cannot fake — the purest test we have.	The honest cut: a GGR pass <i>with</i> an arrivals surge = a tourism-driven beat, which weakens the thesis even on a passing grade. Filed as a branch in the pack, pre-print.
November — the hold split (Q3 filings, per property)	Was the elevated win rate composition (reverts as the low-hold whales return) or furniture (Chairman's Club run-rate)? The 1-in-3 upside branch resolves here.	Weekly bank checks proxy it earlier, noisily. Our fitted model already demoted hold as a <i>September</i> discriminator — it was never a Sept-1 read, and the earlier draft of this deck was wrong to imply it.

Kill rules: daily-rate checks fading mid-August = no adds, review the spreads. Sept-1 ≤ +1.3% = calendar excuse dead: exit remaining premium value, grade the call UNFAVORABLE, sleeve closes to new entries. MSC volume declining again on Aug 13 = that name is dead regardless of the macro.

The honest close. The checks are public. The names are off their lows. Our own courts refused every cash entry and cleared exactly one gated starter — the mechanism survived every court; every vehicle got gated, which is precisely why the expression is a dated debit. If the weekly leaks pre-price everything so smoothly that nothing moves by October 16, we lose the debit to a thesis that technically succeeded, and the sleeve writes that down too. But a wallet

this size does not vanish — tables-not-slots does not lie across three regulators^{[4][5][6]} — and Baccarat Rouge's whole trick is that absence announces itself. So does return. **Quis custodiet?** The calendar does.

[35] Analyst consensus snapshot 2026-08-11 (MarketBeat aggregation, secondary): Moderate Buy, avg PT \$134.19 (high \$150 / low \$120, 19 analysts) vs \$104.79 tape; post-print actions Aug 5–6: Argus \$115→\$130, Barclays \$134→\$136, Stifel \$143, Wells Fargo \$141→\$131, Citi Buy reiterated.

DISCLAIMERS

Not investment advice. This document is a research diary and trade journal, published for entertainment and discussion. Nothing in it is a recommendation, offer, or solicitation to buy or sell any security or derivative. The author is not a licensed investment adviser, broker, or tax professional, and no statement here should be read as personalized advice for any reader's situation.

Positions. The author holds long WYNN call spreads (Oct '26 105/115, Jun '27 110/140, with a resting Nov '26 105/120 order) at the sizes described in Exhibit 5, and long positions in other names mentioned in passing. These positions can change without notice or update to this document. The author stands to benefit if WYNN rises. Read everything here with that bias in mind.

Risk. Defined-risk option spreads can and regularly do expire worthless — the full debit is the expected loss in the failure branch, and this document assigns that branch real probability. Options are not suitable for everyone. Past performance of the desk's forecasting record (the 89%/0.126 figures cited) is a small-sample internal record, not audited, and predicts nothing.

Sources and errors. All statistics are cited to their sources on this page; regulator and company figures are primary, sell-side figures are syndicated secondary, and desk computations are labeled as such. Errors are possible and, on this desk's own record, occur; the falsifier calendar in Exhibit 7 exists so they get caught in public. Forward-looking statements are guesses with dates attached.

Baccarat Rogue · SignalOS, 2026-08-11 (rev. 2: pitch-deck format, full citations) · positions as footnoted; max risk ~76bps gross / ~40bps after tax · frozen call MACAU-GGR|2026-09-01, our_p 0.72, graded regardless of P&L · principal's verbatim lines quoted as marked · sell-side figures are syndicated secondary sources; regulator and company figures are primary · not investment advice. I am not a tax attorney either.
