

PITCH — BBOT — VERDICT

ADJUDICATED 2026-09-16 — FLAT — TAM narrowed (conviction 7/10). The court found nothing to own at this price; the reopen gates below are the only path back.

(Position today: NO POSITION, NO ORDERS. This deck proposes a gated re-open, not an entry. Both benches landed FLAT; they disagree about why, and that disagreement is the whole document.)

What we believe

BridgeBio Oncology Therapeutics is a pre-revenue KRAS/PI3Kα drug developer whose stock has fallen about 64% from its 52-week high of \$14.87 to roughly \$5.40, sitting essentially on its 52-week low. Our original thesis was “damage-absent”: the company was not financially broken — it reaffirmed cash and runway inside the very press release that crashed the stock, filed no impairment item, and its next big data readout lands *inside* funded cash. That narrow claim survived both benches.

But surviving the balance-sheet test is not the same as being a good trade, and we now believe it is not one at \$5.40. Three things changed our mind:

1. **The company moved its own goalposts by nine months.** Earlier guidance promised combination and expansion data in H2 2026. The September 8, 2026 release now points to mid-2027. That is a guidance breach, not a re-ordering of slides.
2. **It walked away from its biggest market.** The lead drug’s best public number — a 63% response rate (26 of 41 patients) in patients who had never been treated with a KRAS G12C inhibitor — sits in the *large* US funnel (~21,000 patients). The company de-prioritized that setting and pivoted to second-line-and-later patients who already failed a G12C drug, where the entire dataset is 17 patients (the headline “75%” is a dose subgroup inside those 17). Choosing to compete where the data is thinnest, against three approved or late-stage rivals, reads as a verdict on the asset rather than a focusing decision.
3. **The prize is roughly fair, not free.** On the benches’ shared math (risk-adjusted value = probability of success × peak sales × 3.0 × a 12%/6-year discount factor of 0.507, i.e. \$1.52 of value per \$1 of peak sales), today’s enterprise value of about \$134M is what you’d pay for a 5–8% success rate on \$1.0–1.5B of peak sales. A 50% move up requires roughly \$350M of pipeline value — about \$1.5B peak at 15% odds, or ~\$2.9B at the 8% base rate. Those are not silly numbers, but they are not free-option numbers either.

So: **not broken, not cheap enough, and the clock just got nine months longer.** We want this name, at a lower price, with two specific facts in hand.

What the market believes

The market is split into two camps that never speak to each other.

The sell side still believes the story. After the September 8 release, JPMorgan kept an Overweight with a \$25 target (trimmed from \$27) and Canaccord kept a Buy at \$20 (from \$23) — roughly four times the tape, and cuts of only 8–13% against a ~24% one-day drop. There is no revenue consensus to anchor against, because there is no revenue.

The tape believes the opposite, and has believed it for nine months. Using the company's own filing covers as price stamps, the stock was \$9.20 on August 11, 2026 and \$8.80 on August 31, 2026 against that \$14.87 high. About 41% of the decline was already gone *before a single new data point printed*. A director option struck around \$7.73 in early July, so the grind actually bottomed mid-summer and then rose about 19% into mid-August before the September event took it to the low.

Net: the market is not arguing about the science on a given day. It is steadily marking down duration, dilution risk, and the credibility of guidance — and the sell side has not followed it down.

Why we might have edge

- **We know precisely what the crash release did and did not say.** The 8-K is Item 8.01 only, attaching the press release and a revised corporate deck — no impairment, no going-concern, no restatement ([SEC 8-K, 2026-09-08](#)). Anyone trading “the company blew up” is trading a headline the filing does not support.
- **We correctly de-bunked the scariest structural story — our own bench's story.** The idea that a 63.05M-share resale shelf (~79% of shares out) being re-registered on September 1 caused the collapse does not survive the lock-up documents: those shares were contractually frozen until roughly August 11, 2026 under a lock-up written into the bylaws ([S-1, 2025](#)). Registration is not release. And the actual unlock was *absorbed* — the stock rose into it.
- **We resolved the largest holder correctly.** The 4,528,186 shares that moved from the sponsor vehicle were distributed for no consideration to three funds inside the same complex, all of which signed a joinder to the same lock-up; the group total is unchanged at 17,878,594 shares / 22.32% ([13D/A primary doc](#)). Zero shares became sellable. Most desks will read “sponsor distribution” as a sell signal. It isn't.
- **We have a clean, cheap, dated way to be wrong or right:** the Q3 10-Q tells us whether the \$200M at-the-market program was actually used. That single fact separates “quiet company husbanding cash” from “issuer selling stock at its low.”

Why it might be priced in

Bluntly: most of it probably is.

- Our best insight — “the balance sheet is fine” — is *already the consensus long*. JPMorgan and Canaccord re-underwrote after the event and still carry \$20–25 targets. We are not the variant view; we're the crowded one, four times below the crowd's price.

- The narrowing that we call the real problem is in the **title of the press release**. It is not a discovery; it is a headline, and both target cuts post-date it.
- The at-the-market program's existence is public (S-3 effective in the same week), so the dilution overhang is in every screen.
- The only genuinely non-public facts left are (a) whether the ATM has been tapped, (b) total liabilities behind the cash, and (c) the date and patient count of the next update. Two of those three resolve on a scheduled filing that anyone can read.

The honest framing: the mispricing, if any, is not informational. It is a *patience* premium — being willing to wait for a mid-2027 readout in a name that burns ~\$45M a quarter and has a live ATM. That premium is real but small, and it is why we're proposing bands rather than a buy.

What could go wrong (PRE-MORTEM, v1.7)

Failure narrative 1 — “The ATM eats the rally.” (Monitorable.) Cash was \$344.1M at June 30, 2026, burning ~\$44.8M per quarter → about \$299M at September 30 and about \$165M (\$2.06/share) by a mid-2027 readout. The company has a \$200M at-the-market facility live at the 52-week low. The reflexive trap: every bounce we participate in is precisely the price level at which the issuer is most likely to sell stock. We bid, they print. In this branch we're not wrong about the science — we're wrong about who is on the other side of our own strength. *Tripwire: Q3/Q4 10-Q share count and any 424B5; price gate below \$4.10.*

Failure narrative 2 — “Guidance slips again.” (Monitorable, weakly.) H2-2026 already became mid-2027. A company that moved a dataset nine months once can move it again, and the second slip costs far more because the cash floor has dropped to roughly \$2.06–2.30/share by then. *Tripwire: any 8-K/PR that re-words the mid-2027 timing, or a Q4 “update” that arrives without a dated combination readout attached.*

Failure narrative 3 — “The drug is quietly worse than the slides.” (NO MONITORABLE TRIPWIRE.) The de-prioritization of the treatment-naïve setting may not be strategy; it may be that internal, undisclosed data — dose-limiting toxicity, early discontinuations, short duration of response, a competitor's head-to-head we haven't seen — made that fight unwinnable. Nothing in EDGAR, no price gate, and no 13D/A will show this. It surfaces only at the readout, by which time the stock has already moved. **Unknown-unknown class: silent-science risk** — non-disclosable in-trial signals (tolerability, durability, enrollment quality) that are legally invisible between data cuts, compounded by **competitor-set blindness** (neither bench could pull the clinical trial registry, so we do not actually know what the rival G12C salvage programs are enrolling). We cannot arm a sensor for this. We can only size for it.

The reflexive / structural leg. - *Our own size vs. liquidity:* we do not have average daily volume in the pack — that is a drain item, not an assumption. At a proposed $\leq 0.25\%$ starter on a ~\$430M market cap, our clip is small in dollars but this is a de-SPAC with a 79%-registered float and thin natural sponsorship; in a stressed tape we would likely be a meaningful share of the day's volume and we should assume we cannot exit in one session. - *Predicted flow:* the dominant predicted flow is the issuer itself. An ATM is a price-elastic seller — it converts our buying into supply. Secondly, the now-unlocked legacy holders are *able* to sell (lock-up expired ~August 11, 2026)

even though they have not yet done so in size. - *Doctrine interactions*: this deck leans on **DIVERGENCE-NOT-COVERAGE (2026-08-17)** to treat the 4x street/tape gap as an anchor rather than a kill — but that doctrine cuts against us here, because once the supply mechanism was refuted the gap must be *fundamental*, and the tape is the better underwriter. It also leans on **registration-is-not-release** (our own new mechanism) to dismiss the supply kill — if that doctrine is ever wrong in a specific case (e.g., a waiver or early release we never saw), our entire rebuttal of the supply story collapses and Red’s original kill is restored at full strength. And the **anchor-and-adjust** discipline in the prize table means our scenario prices are anchored to visible tape levels (\$2.06 cash floor, \$8.80 pre-event, \$14.87 high), which systematically under-imagines a true blue-sky partnering outcome.

If this position loses money, the most likely reason will be that we bought a nine-month wait in a pre-revenue company with a live at-the-market program at its 52-week low — and the issuer, not the science, supplied the shares that capped every rally while the real readout kept moving right.

What we checked ourselves

Claim	How checked	Found	Confirmed?
“The –63% is the Sept 8 event”	Price stamps on the company’s own filing covers (\$9.20 on 8/11/26; \$8.80 on 8/31/26) vs. \$14.87 high	~41% of the fall happened before any data printed; event day was ~24%	NO — our thesis mis-dated the damage
Shape of that pre-event decline	Director option strike ~\$7.73 (early July, 13D/A) + cover prices	A nine-month grind that bottomed in July and <i>rose</i> ~19% into August — not a single step	Confirmed (corrects Red, which implied a step)
“Only near-term dilution is a discretionary ATM”	EDGAR inventory + POS AM / 424B3	63,054,549 shares registered for resale ≈ 79% of shares out; \$200M ATM effective the same week	Partly — the shelf is real, the <i>conclusion</i> was wrong (next row)
OUR BENCH ERRED: resale shelf = supply event	Lock-up language in the S-1, incorporated into the bylaws	Shares were frozen to ~8/11/26; the POS AM (9/1) post-dates the decline it was blamed for; the unlock was absorbed	NO — Red’s kill overturned; its lock-up calendar was ~3 weeks off, in the direction that manufactured the kill
OUR BENCH ERRED: sponsor distribution = supply near the tape	13D/A primary document	4,528,186 shares moved for no consideration <i>within</i> the same fund complex; group total unchanged at 22.32%; recipients signed a lock-up joinder	NO — zero shares became sellable; the joinder is the restraint, cited as the risk
OUR BENCH ERRED: share count / component math	10-Q vs 424B3; Red’s own stack	Red used 80,174,267 shares vs 80,107,104 in the latest 10-Q; its resale components sum to 61.15M, not 63.05M (~1.9M unexplained)	NO — arithmetic not reconciled
OUR PACK ERRED: tape rails	Pack fields	px 5.40 sits <i>below</i> lo52 5.48 (pct_off_low –0.015) — internally impossible; Red silently substituted 5.565, a	NO — every per-share/EV figure is rail-dependent to roughly ±\$13M

Claim	How checked	Found	Confirmed?
		number the pack does not carry	
“Cash floor \$3.71/sh, ~33% downside”	\$344.1M at 6/30/26 ÷ 80.107M shares, forward-rolled	\$4.30/sh today gross, \$3.74 at 9/30E, \$2.06 by mid-2027 at \$44.8M/qtr (≈\$2.30 if burn falls to \$40M post-narrowing)	Confirmed as arithmetic; the “\$3.71” is a <i>forward</i> number, not today’s
“A raise is required before the readout”	Same arithmetic	~\$165M still on hand at the readout; exhaustion ~Q1-2028 → readout is <i>inside</i> funded runway	NO — overturned; the raise is likely, not forced
Gross vs net cash	Attempted liabilities/lease pull	Neither bench pulled total liabilities — all cash-per-share figures above are GROSS	NO — shared coverage gap, now a drain item
“Narrowing is deferral, not damage”	Company press release, 9/8/26, vs prior corporate deck	Naïve setting (63%, 26/41) de-prioritized for a 2L+ combo with N=17; prior H2-2026 guidance became mid-2027	NO — the narrowing is real and it is also a guidance breach
Headline response rate	Press release vs secondary aggregator	PR says 63% (26/41); a secondary source rendered it “65%”; the marketed “75%” is a dose subgroup of N=17 while the fuller cross-dose number is 53%	Confirmed — use the PR, use the fuller metric
Street anchors	Post-event published targets	JPM Overweight \$25 (from \$27); Canaccord Buy \$20 (from \$23)	Confirmed as data; not confirmed as edge — it makes us the consensus
XBRL block in the pack	Direct read	Stale and dimensionally broken (SBC values with no consistent units, diluted share count blank, most recent period 2025-03-31)	Unusable — both benches concur, not used anywhere in this deck
Prize-table roof	Re-ran the benches’ formula ourselves	\$1.52 of value per \$1 of peak sales; +50% on the stock needs ≈ \$350M of pipeline value, not the \$370M both benches quoted (they used a stale market cap)	Confirmed with a correction — the conclusion (“roughly fair, not free”) stands
Clinical registry checks	Attempted	No registry access at either bench — enrollment status of the 2L+ combo cohort and the competing salvage trials are unchecked , and that is the exact check that would grade our biggest finding	NO — open
Science brief cited by our own bench	Pack read	Red references “the brief’s ‘Cormorant direction unverified’” but the SCIENCE BRIEF section of the pack is empty — no artifact	NO — the deck therefore omits a Science Brief Digest; if an artifact exists, it never reached the pack, and that is a pack-assembly gap

Claim	How checked	Found	Confirmed?
		filename exists to carry forward	

PROPOSED ENTRY BANDS

Both benches say no entry today. This is a REOPEN schedule, not a buy. Current price ~\$5.40 (rails broken — confirm on a live quote before acting).

Why no entry at \$5.40: you are paying an enterprise value of ~\$133M for a pipeline worth ~\$134M at an 8% probability on \$1.1B peak sales — i.e., fair — while waiting nine months and carrying ATM risk.

Reopen band 1 — VALUE BAND: \$3.60–\$4.10. Basis: \$3.74/share is projected gross cash at September 30, 2026; \$4.30 is gross cash today. Buying at \$3.60–4.10 means paying at or below cash and getting the three-asset pipeline free. Size: **0.25% of book** (a $\leq 1/6$ -of-target starter; full target 1.5%). This band is *conditional* — it requires no evidence of heavy ATM issuance (see kill conditions).

Reopen band 2 — EVIDENCE BAND: up to \$6.25, only with BOTH gates green: - (i) Q3 10-Q shows **zero (or de minimis, <1% of shares) ATM issuance**, and total liabilities small enough that **net cash** $\geq$ \$3.30/share; and - (ii) a company release that **puts a date** on the Q4-2026 BBO-11818 / BBO-10203 update **and** shows combination data with **N $\geq$ 40**. Size on both gates green: **0.75% of book** (half target). If only gate (i) is green, the value band still applies; gate (ii) alone does not justify paying up.

Add: a further 0.5% only if the mid-2027 8520 combination readout is *dated* by the company and cash at that point is tracking $\geq$ \$2.30/share (implying burn fell post-narrowing, which is the quiet bull tell).

Trims / exits: - Trim one-third at **\$8.80** (the August 31 pre-event cover price — the level the market itself paid before the narrowing). - Trim to half at **\$11.25** (February 2026 level). - Hard exit / do-not-enter if: ATM issuance exceeds ~5% of shares outstanding below \$5.00; **or** the Q4 update lands with combination $N \leq 20$; **or** the mid-2027 timing slips again; **or** net cash per share is shown below \$3.00.

Catalyst dates: - **2026-11-11** — presumed Q3 print. *yfinance-derived and UNCONFIRMED*; no company PR or 8-K in the pack names a Q3 date, and the 9/8 8-K is Item 8.01 only. **Print proximity: none within 5 trading days. Pre-print position: FLAT.** - **Q4 2026 (undated)** — company-guided BBO-11818 / BBO-10203 **monotherapy** update. Note: monotherapy, not the prioritized combination, so this is a lower-value catalyst than it sounds. - **Mid-2027 (undated)** — BBO-8520 2L+ combination readout. The actual value event. - **~Q1 2028** — projected cash exhaustion at current burn. - **~2026-08-11 — already passed** — legacy lock-up expiry; absorbed, tape rose into it.

ARMED SENSORS

(armed provisionally with this deck; session adjudication ratifies)

- price alert: fires below 3.3 (deck-provisional: net-cash floor fails; implies heavy ATM issuance or undisclosed liabilities — do not enter, re-underwr)
- filing watch: 424B5, 10-Q until 2027-03-10 (deck-provisional: the only way to see whether the \$200M ATM has actually been tapped — highest-value single fact in the)
- dated pack BBOTI2026-11-11: BBOT: presumed Q3 2026 print — yfinance-derived, no company PR or 8-K names it; also the resolution date for ATM issuance and liabilities (d
- dated pack BBOTI2026-12-15: BBOT: placeholder for the company-guided Q4-2026 BBO-11818/BBO-10203 monotherapy update — undated by the company (date confirmed=False)
- dated pack BBOTI2027-06-30: BBOT: placeholder for the BBO-8520 2L+ G12Ci-experienced combination readout, guided 'mid-2027' (slipped from H2-2026) — the real value even
- dated pack BBOTI2028-03-31: BBOT: projected cash exhaustion at \$44.8M/qtr burn from \$344.1M at 6/30/26 (date confirmed=False)

What remains unverified

1. **ATM issuance to date under the \$200M program.** Not drainable now; resolves on the Q3 10-Q (~2026-11-11). Estimate: **\$0–25M sold**, with roughly a 45% chance of literally zero — base rate from small-cap biotechs that have just reaffirmed runway and usually avoid printing stock at a 52-week low immediately after a negative catalyst.
2. **Total liabilities and lease obligations** (gross vs. net cash). Drainable **now** via XBRL on the 6/30/26 10-Q (accession 0001193125-26-344661). Estimate pending the pull: **\$45–75M**, based on sibling clinical-stage SSF-based developers with a single leased lab — which would put net cash near **\$3.35–3.70/share** at 9/30E.
3. **Date and patient count of the Q4-2026 BBO-11818 / BBO-10203 update.** Company-gated, not drainable. Estimate: a dated release lands between **mid-November and mid-December 2026** with probability ~0.55; combination **N of 15–35** (the prioritized cohort was N=17 at the September cut).
4. **Enrollment status of the 2L+ G12Ci-experienced combination cohort.** Drainable **now** via the clinical trial registry; neither bench had access. Estimate if not drained: **N=25–45 enrolled** by the Q4 update, from typical Phase 1 expansion enrollment rates.
5. **Competitor post-G12C salvage programs** (sotorasib / adagrasib / divarasib). Drainable **now** via registry. This determines whether the 2L+ pivot is a defensible niche or a crowded one. Estimate: **2–4 active competing salvage/combination programs**.
6. **Whether a liquid options chain exists, and its chain-level implied volatility.** Drainable **now** via the broker connector. Estimate: chain likely exists (Nasdaq Global Market listing, post-de-SPAC), 1-year at-the-money IV **85–120%**, with wide spreads.
7. **Average daily volume and realized volatility.** Drainable **now** via the broker connector. Estimate: **ADV 0.8–2.5M shares; RV 80–110% annualized** — de-SPAC biotech at a 52-week low.

8. **Confirmation of the Q3 print date.** Not drainable; requires a company PR. Estimate: **2026-11-05 to 2026-11-17**, probability ~0.70.
9. **Post-narrowing quarterly burn.** Not drainable until the Q3 10-Q. Estimate: **\$36–44M/quarter** (deprioritized expansion cohorts should reduce trial spend by 10–20%) versus the \$44.8M both benches projected flat.
10. **The ~1.9M-share gap** between the 63,054,549 registered resale shares and the 61.15M component stack. Drainable **now** by reading the POS AM / 424B3 cover tables directly.
11. **Post-9/8 direction of the Cormorant complex.** Not drainable until the next Form 4 / 13D/A. Estimate: **no change** most likely (~0.65), given the lock-up joinder on the distributed shares.

PRIZE TABLE + VOL READ

Required here because items 1, 3, 8, 9 and 11 above are genuinely time-gated or private.

Anchors used (anchor-and-adjust): \$2.06 = gross cash/share at the mid-2027 readout; \$4.30 = gross cash/share today; \$5.40 = spot; \$8.80 = the August 31 pre-event price; \$14.87 = 52-week high. Horizon: **12 months** (through ~Sept 2027, so the mid-2027 readout is inside it).

#	Scenario (12 months)	Probability	Price
1	ATM tapped into weakness and/or a second guidance slip; stock trades toward the depleted cash line	0.20	\$2.50
2	Nothing decisive; burn continues, Q4 update is thin monotherapy, dilution at low prices	0.30	\$4.00
3	Base: cash preserved, Q4 update arrives undramatic, mid-2027 readout still ahead	0.25	\$5.50
4	Gates green — dated Q4 update with combination N≥40, zero ATM issuance; re-rate to the pre-event level	0.17	\$9.00
5	Mid-2027 combination data is clearly good and/or a partnership prints	0.08	\$18.00

EV = \$6.05 vs. \$5.40 spot = +12.0%.

That is the whole case in one number: a positive but *thin* expected return, against a standard deviation of **\$4.09 (75.8% of spot)**. Twelve percent of edge does not pay for that much dispersion. This is exactly why the verdict is FLAT-with-gates rather than a buy. The bands above exist to buy the same distribution at \$3.60–4.10, where the same table returns roughly +50% to +68%.

Bimodality — and it's fork-dated. The distribution has two distinct fork dates (an undated Q4-2026 monotherapy update and an undated mid-2027 combination readout) and two separated masses: 50% of the probability sits at \$2.50–4.00, while 25% sits at \$9.00+. There is very little

mass at the middle. A single-volatility model will systematically **overprice** near-the-money exposure and **underprice** the right tail. Our table's lognormal-equivalent volatility is **61.4%**, materially below its arithmetic dispersion of 75.8% — that spread *is* the bimodality.

Expression math (shown, per doctrine):

Our table prices one-year calls as $C_{ours} = \sum p_i \times \max(S_i - K, 0)$:

Strike (1-yr)	C_ours from the table	Implied vol that makes the chain fair vs our table
\$5.00	\$1.845	77.0%
\$7.50	\$1.095	76.3%
\$10.00	\$0.640	74.0%

Read: our view is worth roughly a **74–77% implied volatility**. $\sigma_{table} \times \sqrt{T} = 75.8\%$ for $T = 1$, which is the same answer from the other direction and confirms the arithmetic is internally consistent.

The problem: there is no options chain in the evidence pack, and we will not substitute an underlying-level aggregate volatility feed for chain-level quotes. That is the TSSI lesson — the aggregate feed printed 71 while the chain printed 101, and trading off the wrong one is how you buy “cheap” volatility that isn’t. We therefore cannot compute IV-vs-RV, an IV percentile, or the volatility risk premium (IV – RV) today. Both inputs are drain items (#6 and #7 above), and our *estimate* — chain IV 85–120% against realized volatility of 80–110% — implies a **volatility risk premium of roughly +5 to +10 points, i.e. modestly rich**, which is typical for a post-catalyst small-cap biotech.

Instrument recommendation — the output of the arithmetic above:

NONE today. Then, mechanically, once the chain is pulled: - If **chain midpoint IV < 74%** on the specific \$7.50 or \$10.00 strike → our table says those calls are cheap; express the gated add in **calls**. - If **chain midpoint IV > 77%** (our estimate says it will be, by a wide margin) → calls are rich against our own distribution; route to the **premium-selling gate**: a cash-secured put struck **\$4.00**, which is our value band — we are paid to bid where we already want to bid. - Between 74% and 77% → indifferent; use **common stock** at the band. - Our estimated 85–120% IV sits well above the 77% ceiling, so the *expected* output is **cash-secured put at \$4.00, or plain stock at the band — not long calls.**

TAX OVERLAY. The loss branch must land in the intended tax year. The mid-2027 catalyst forces any call expression past December 31, 2026, which **defers the loss branch into 2027** — so during a harvest year, long-dated calls are **excluded unless the edge numerically dominates**. It does not: +12% EV at spot is not dominance. A December-2026-expiry cash-secured put keeps the premium and any assignment consequence in-year, but straddles only the *undated* Q4 update, so it is a tax-clean expression of a weak catalyst. Conclusion: **no options expression is authorized in a harvest year at current EV; if the value band fills, take it in common stock.** (We currently hold no position, so there is nothing to harvest against — this constraint binds only new expressions.)

(No Science Brief Digest section appears in this deck because the SCIENCE BRIEF block in the evidence pack is empty. Our Red bench referenced “the brief” — if a brief artifact exists, it never reached the pack, and that assembly gap is logged in the What-we-checked table above.)

ADJUDICATION — 2026-09-16 15:37Z

The 9/8 narrowing is TAM destruction (naïve G12C funnel vacated for an N=17 combo cohort) and a ~9-month slip of guided H2-26 data to mid-2027. Human-gated biotech.

REOPEN GATES: Q3 10-Q: zero ATM issuance AND net cash $\geq$ \$3.30/sh; dated Q4 11818/10203 readout with combination $N \geq 40 \rightarrow \leq 1/6$ (paper)
