

BTDR pitch deck

The court is complete and both benches converge on FLAT into the print, so this deck is written as a no-entry pitch with reopen bands. Everything below is drawn from the evidence pack and the two bench rulings; no new claims are introduced.

PITCH — BTDR — PROPOSED VERDICT (one line)

PROPOSED — PENDING ADJUDICATION: NO ENTRY (stay flat) into the August 10 earnings report; re-run the court within 48 hours of the print, with specific reopen conditions below.

What we believe

Bitdeer (BTDR, \$10.88, down 61% from its 52-week high) owns real assets: a bitcoin-mining and data-center business that just signed a \$4.7 billion, 16-year lease for its Tydal, Norway campus with an AI-computing tenant. The asset story is not fake, and even our own prosecution bench conceded the price is not absurd.

But we believe the stock is un-ownable **right now**, for three reasons acting together:

1. **The cash burn is real, not an accounting illusion.** The bull case claimed the huge first-quarter cash outflow (−\$346.9M from operations) was mostly voluntary — prepaying for chip wafers to build inventory. The balance sheet says otherwise: the prepayment balance actually *fell* by about \$336M while inventory rose \$361M — those two roughly cancel. After both benches fought over the number, the genuine, structural cash burn is bounded at roughly **\$100–150M per quarter**, from a business that ran a *negative* 20.7% gross margin.
2. **The company is already selling stock to fund itself.** Its own filing says Q1 financing came from “convertible senior note issuance in February, borrowings **and ATM program**” — an at-the-market program is ongoing share sales. The claim that this is financeable “without touching the equity” was already false when it was made.
3. **Tomorrow’s earnings report is the most likely venue for more dilution.** With about \$261M of unrestricted cash against that burn, and three convertible bonds outstanding (~\$1.015B, one of which converts at \$9.93 — *below* today’s price), the base-case headline at the print is a financing announcement, not a clean quarter.

One more finding that cuts against the bull: **the bitcoin treasury is essentially gone** — 31 BTC held at Q1-end versus 1,156 a year earlier. About \$210M of the “digital assets” line is *receivables* (possibly pledged or lent coin), not liquid cushion.

What the market believes

At \$10.88 the market has already cut the stock 61% from its high but holds it 57% above its low — a middle-ground price that says: “the Tydal lease is probably real and worth something, the burn is scary, and we’ll find out more Monday.” Institutional holders filed two 13G ownership stakes in late July, so this is not an abandoned name. The market is pricing neither collapse nor the bull’s \$1.7–2.1B Tydal valuation — it is waiting for the same print we are.

Why we might have edge

- **We resolved the decisive question before the print.** The bull thesis framed Q2 earnings as the event that would reveal whether the burn was “discretionary inventory build” or “true burn.” Our prosecution bench showed the Q1 balance sheet *already answers this* — the prepayment-release/inventory-build wash means the escape hatch was arithmetically dead before the print. That is knowable now, and most holders likely haven’t done the decomposition.
- **We read the lease’s fine print.** The \$4.7B Tydal lease’s \$1.3B credit backstop is **milestone-gated, not posted**: the letters of credit are “subject to customary conditions,” and Bitdeer itself holds a termination right if the tenant (Volta — a company that came out of stealth *for this deal*, with no credit rating) misses backstop milestones. The tenant also has a no-fee walk-away right at year 10 of a 16-year lease. Headline value \$4.7B; risk-adjusted value in the unposted-backstop state is \$0.8–1.0B by our benches’ math.
- **We caught the treasury drawdown.** The 31-BTC figure and the \$74M unexplained build in digital-asset receivables are details that change the liquidity picture and that we found only by pulling the primary filing.

Why it might be priced in

Honest concessions, stated plainly:

- A 61% drawdown is a lot of bad news already in the price. The market may have substantially priced the dilution risk we’re describing.
- Our own defense bench showed the scariest version of our burn number was wrong (see the table below) — the corrected \$100–150M/quarter burn, against demonstrated capital-markets access (\$568M raised in Q1 alone), gives 2–3 quarters of runway, not the “less than one quarter” the prosecution first claimed.
- The dilution math is less bad than it sounds: if the converts convert, ~\$1B of debt is extinguished at the same time, so on an enterprise-value basis conversion is roughly neutral, not a 31% haircut.
- If the letters of credit get posted, the lease genuinely becomes bank-grade credit, and a \$1.7–2.1B valuation for Tydal becomes defensible. We are one filing away from the bull being right.

This is why the court’s rejection is about **timing**, not a claim the company is worthless.

What we checked ourselves

Claim	How checked	Found	Confirmed?
Q1 cash outflow was “wafer prepayments / discretionary growth”	Pulled the Q1 results filing (primary)	Prepayments <i>fell</i> ~\$336M while inventory rose \$361M — the prepay balance was released, not built; the escape hatch is dead	Refuted (the bull claim)
“~\$320M of Q1 outflow is true P&L burn” (our own red bench)	Blue bench recomputed against the income statement	Impossible — total net loss was only \$159.5M; the residual is other working capital (digital-asset receivables +\$74M alone). Structural burn ≈ \$100–150M/q. Our red bench overstated its killer number ~2× .	Bench error, corrected
“Financeable without touching the equity”	Filing language, verbatim	Q1 proceeds included an “ATM program” — equity sales already running; share count up ~10M since the Q1 weighted average	Refuted (the bull claim)
Convert stack = 31% hidden dilution (our own red bench)	Blue bench cross-check	Double-count: conversion extinguishes ~\$1.015B of debt already inside EV; roughly EV-neutral. Real but a sizing note, not fatal. Second red-bench error, corrected.	Bench error, corrected
\$1.3B Tydal credit backstop is bank-posted	Read the lease press release verbatim	Milestone-gated, “subject to customary conditions”; Bitdeer can terminate if milestones slip; tenant is an unrated stealth-launch SPV with a year-10 walk-away	Confirmed
Tydal worth \$1.7–2.1B today	Both benches’ discounted-value math	State-contingent: ~\$0.8–1.0B until the credit support is posted; \$1.7–2.1B defensible only after posting	Partially — depends on LC posting
Earnings date Aug 10 pre-market	Company press release	Confirmed — next session is the print	Confirmed
BTC treasury cushions the balance sheet	Q1 filing detail	31 BTC held (vs 1,156 a year prior); \$209.9M of “digital assets” is receivables, not liquid coin	Refuted (the bull claim)
July insider Form 4 cluster (buys or sells?)	SEC pull attempted	Blocked (403 error) — contents unread	Not confirmed — open gap

PROPOSED ENTRY BANDS

The court’s verdict is **no entry before the August 10 print**. These are the reopen bands, taken from the benches’ own math — none is an order until adjudicated and re-courted:

Reopen for a starter position (proposed ~0.5% of book, pending re-court) if, after the print: - The Q2 cash-flow decomposition shows structural burn (excluding working-capital swings) of ≤ **\$150M for the quarter**, AND - Either **signed non-recourse Tydal project debt of ≥ \$400M with no concurrent equity raise**, or the **\$1.3B letters of credit actually posted**.

Price-based re-looks (cheaper entry for the same re-court): - **Below \$9.93** — the February-2026 convertible’s conversion price; below it that note is no longer in the money and the standing

dilution overhang recedes. - **Below ~\$6.92** — the 52-week low; capitulation pricing would shift the risk/reward even under the unposted-backstop valuation (\$0.8–1.0B for Tydal).

Kill triggers (close the file for this cycle): - An equity or convertible raise announced at or around the print. - Disclosure that Volta has missed the credit-backstop milestones or that LC posting has slipped.

Catalyst dates: Q2 2026 earnings, **2026-08-10 pre-market (confirmed by company press release)**. Re-court within 48 hours of the print or of any financing disclosure, whichever comes first.

ARMED SENSORS

(armed provisionally with this deck; session adjudication ratifies)

- price alert: fires below 6.92 (deck-provisional: 52-week low — capitulation re-look even under the unposted-backstop Tydal valuation (\$0.8-1.0B))
- filing watch: 6-K until 2027-02-05 (deck-provisional: Q2 print, any financing, and LC-posting news all arrive as 6-Ks for this foreign issuer — reopen and k)
- dated pack BTDR|2026-08-10: BTDR: Q2 2026 earnings pre-market — burn decomposition + probable financing headline; re-court within 48h (date confirmed=True)

What remains unverified

- **The July 6 Form 4 cluster (5 filings)** — SEC blocked the pull; we do not know whether insiders were buying or selling into this price.
- **Short interest / crowding** — no discovery_state read; if the burn story is already a crowded short, the print could squeeze against a flat stance's re-entry plan.
- **The +\$74.3M digital-asset receivables build** — unexplained drain; whether coin is pledged, lent, or encumbered awaits the Q2 filing.
- **Tydal physical construction progress** — no satellite or permit verification of the shell; the lease's value depends on delivery milestones we have not independently observed.
- **Volta's end customer** — the "leading AI lab" behind the tenant has no visible customs or public trail; the tenant's real credit is unverifiable until the LCs post.
- **The exact Q2 numbers** — revenue rebuild (~\$230–245M) is a reconstruction, not a company figure, until tomorrow.
