

CASY pitch deck

PITCH — CASY — VERDICT: PROPOSED — PENDING ADJUDICATION

No position, no order, no immediate entry: at the pack's live \$635.93 our own scenario table prices the stock at \$537 (−15.5%), so the proposal is a ladder buy program starting \$565 and below, not a buy today.

What we believe

Casey's is a good, boring, slowly-compounding retailer that just printed a quarter whose headline growth was mostly rented from a fuel margin it does not control, and the market correctly took the multiple down for it.

Three things we think are true:

1. **The store is fine.** Inside same-store sales +3.2% against a hard 4.5% year-ago comp, inside margin up ~30bp to about 42.2%, prepared-food and dispensed-beverage +4.8%, guidance untouched. Nothing broke.
2. **The earnings did not really grow 27.7%.** Fuel margin went from 41.0¢ to 47.8¢ a gallon on essentially flat volume (same-store gallons −0.3%). Roll fuel margin back and the quarter grew somewhere between +1.7% and +4.3% at the EBITDA line and +5.3% to +8.8% at the EPS line. Call it high-single-digit, not high-twenties.
3. **The price still has not adjusted enough.** \$635.93 is 33.2x reported trailing EPS of \$19.16 and roughly 34x our fuel-normalized FY27 estimate. That is a compounder multiple on a mid-single-digit-to-high-single-digit compounder whose recent upside came from a commodity spread.

So: the business is not damaged, but the stock is not cheap. Down 31.5% from the high is a fact about the high, not a fact about value. We want to own this — lower.

What the market believes

The market believes two things at once, and they are both defensible.

The seller believes what we believe: that a beat built on street fuel margin is low-quality, that the reaffirmed guide implies the back nine of the year grows only +4.5% to +7.3% at EBITDA, and that a stock at 38-48x (where insiders were buying back \$45.6M of it last quarter) had nothing priced in but perfection. That view has already moved the stock 31.5% off the high.

The buyer believes the fuel margin step-up is at least partly permanent — that the Fikes/CEFCO acquisition brought a fuel terminal in Waco, Texas, and with it real supply-cost integration, so 46-48¢ is the new floor rather than a 2026 spike. That buyer also believes ~500 new stores of unit growth and a 10-million-member rewards program keep the inside box compounding, and that S&P 500 membership plus a defensive-consumer bid supports the multiple.

Neither bench could find the sell-side consensus number for FQ2 fuel margin or FY27 EPS this session. That is a real hole: we are arguing about whether something is priced in without the price-in rail. We say so rather than pretend.

Why we might have edge

- **We did the normalization arithmetic and, unusually, we did it in both directions.** Our bear bench rolled fuel margin back to last year's 41.0¢ but left the credit-card fees inflated by \$3.99/gallon retail sitting in operating expense — a \$10M item it had itself sized two findings later. Our bull bench caught that and re-ran it symmetrically. Then we caught our bull bench: card fees track the *price* of fuel, not the *margin* on it, and margin can compress with crude flat. So the honest answer is a state-dependent band (+1.7% to +4.3% EBITDA), not either bench's single number. Most people will carry one of those two numbers around; we carry the fork.
- **We know the industry mid-cycle, and both benches' baseline was generous.** A NACS explainer citing an OPIS weekly report puts the average retail fuel margin at "35.7 cents per gallon" (<https://www.convenience.org/Media/conveniencecorner/Who-Makes-Money-Selling-Gas>). So the 41.0¢ "normal" both benches used is already above the industry average, and 47.8¢ is way above. Normalizing to 41¢ is the *friendly* case.
- **We have a named, testable structural question that nobody has answered.** If $\geq 4\text{¢}$ of the +6.8¢ comes from the Waco fuel terminal, the bear case is half wrong and the stock is worth ~\$610. If it comes from crack-spread luck, it is worth ~\$450-530. That is one question with a bounded answer, and there is an independent instrument for it (terminal throughput imagery) that nobody on the street runs.
- **We are patient and unlevered on this name.** No position, no expiry, no funding cost. The only thing we have to do is not buy at 34x.

Why it might be priced in

- The stock is already down 31.5% from its high and 24 hours of the internet has already said "the beat was fuel." Our bull bench graded three of the bear bench's four load-bearing kills as **consensus, not novel** — the original research brief itself opened by conceding that the beat was fuel-driven and pre-quantified more than 55% of the incremental gross profit as coming from it. If our best insight is on page one of the bear thesis, it is in the price.
- Revenue +24.3%, gallons +2.6%, \$3.99/gal, same-store gallons -0.3%: all of this is in the company's own press release. Nothing here is proprietary.
- The 33x multiple is public. Anyone can divide.

- The genuinely non-consensus part of our work is the *symmetry* correction and the mid-cycle band — and those make us *less* bearish than the loudest bear, which is not an edge that pays unless we buy. And we are not buying today.
- Honest possibility: the market has already discounted mean reversion and \$636 is the right price for ~\$18.85 of normalized earnings at a defensible 33-34x for an S&P 500 staple. Our base case says 28x. If we are wrong about the multiple by five turns, we are wrong about the whole deck.

What could go wrong

Failure narrative 1 — the fuel margin reverts harder and faster than mid-cycle, and the inside box slows at the same time. Crude falls, street margin goes to the high-30s (which the NACS/OPIS series says is normal), FQ2 inside comps come in below 3% against that hard 4.5% base, and the guide gets cut in the spring. Earnings and multiple fall together — the classic double. Price outcome: \$415 area. *Tripwire: monitorable.* Weekly EIA/OPIS retail margin series below a 40¢ four-week average; FQ2 print 2026-12-08 showing cpg <42¢ with inside SSS <3%.

Failure narrative 2 — nothing happens to earnings and the multiple keeps going anyway. The “quality compounder” bid rotates out and CASY drifts toward the c-store peer band, which our bull bench flagged as historically mid-to-high teens and which **neither bench ever actually pulled**. On \$17-19 of earnings a 19-22x multiple is \$325-415, and there is no earnings event to argue with. Price outcome: \$322-415. *Tripwire: weak.* We can arm a peer-multiple rail (we have not), but multiple compression has no announcement date, so the tripwire lags the damage.

Failure narrative 3 — the inside store was never as good as the reported comp, and we find out four to eight quarters late. NO MONITORABLE TRIPWIRE. Two mechanisms, both invisible from outside: (a) competitive substitution — Buc-ee’s/QuikTrip/Wawa-style large-format and grocery/dollar-channel encroachment eating the rural prepared-food moat store by store, with no published share series to watch; (b) the 42.2% inside margin being held up by vendor allowances, promotional accounting and rewards-program deferral choices rather than pricing power. Neither shows up in a filing, a permit, a plume, or an app review until it appears as a comp miss that gets blamed on weather. **Unknown-unknown class: slow-variable, unobservable-state erosion in a market with no independent share or unit-economics series — a state variable, not an event.** There is nothing to arm. The only defense is position size and the willingness to be wrong cheaply, which is why the first tranche is small and low.

Reflexive / structural leg. - *Our own size is not the problem.* CASY is an S&P 500 constituent with multi-hundred-million-dollar average daily volume. A full 3.0%-of-book position is a rounding error against one day’s ADV; we can enter and exit in a single session with no impact. There is no reflexivity from us. - *Crowding at our own levels is the problem.* Our entry bands (30x, 27x, 24x normalized) are the same bands every quality-at-a-price fund uses on this name. We will be filling into a bid made of people running our doctrine, and that bid disappears at exactly the moment it is tested. - *Gate correlation is ~1.* All three of our release conditions (cash conversion, structural margin attribution, FQ2 comp) resolve on or around one date, 2026-12-08. We do not get staged information; we get one binary. That makes the position path-dependent on a single print in a way the position size must

respect. - *Doctrine interactions cut both ways and are unstable*. Two competing pattern candidates came out of this court: the bear bench's `rented_margin_beat_derate` (which, if ratified into the atlas, would auto-suppress this very entry) and the bull bench's `asymmetric_passthrough_normalization` (which, if ratified, weakens the bear case that suppresses it). If either is adopted before 12/08, our sizing changes for reasons that have nothing to do with Casey's. - *Passive float*. Index ownership means a meaningful share of the float is price-insensitive. That cushions the down branch and thins the effective float on the way down — the same fact makes moves in both directions larger than the fundamentals justify.

If this position loses money, the most likely reason will be that we paid a compounder multiple for a business whose recent growth came from a pass-through commodity margin, and the multiple — not the earnings — did the damage, with no dated event to warn us.

What we checked ourselves

Claim	How checked	Found	Confirmed?
The live price rail	Recomputed <code>dd52</code> and <code>pct_off_low</code> against the pack	Pack rail is \$635.925 (−31.46%, +28.06%). Both our benches quoted rails that are nowhere in the pack: red used 636.78, blue used 635.33 and asserted it “reconciles exactly” — it does not (635.33 → +27.94% off low vs pack 28.1%). The bench prosecuting a misquoted tape misquoted the tape.	YES — and both our own benches erred
Fuel gallons and the 41¢ rollback	446.9/0.478 and 373.7/0.410	934.9M vs 911.5M gallons (+2.6%); fuel GP at 41.0¢ = \$383.3M, a −\$63.6M hit	YES
“Normalized EBITDA +1.7%, EPS +5.3%” (bear)	Re-ran with the credit-card fee add-back the same bench sized	Symmetric version is +4.1-4.3% EBITDA / +8.8% EPS. Red's normalization was one-sided.	YES — red overstated
“Red overstated the damage 2.5x” (bull)	Checked what card fees actually track	Card fees track fuel price (\$3.99/gal), not fuel margin . Margin can compress with crude flat — in that state red's asymmetry is correct. Blue's correction is itself state-dependent. Honest answer: EBITDA +1.7% to +4.3%.	YES — blue also erred; our band replaces both point estimates
Brief's self-certifying tape check	$733.47 \times (1 - 0.1424)$	= 629.02 , not 633.03. The integrity flag failed its own arithmetic. Pack rail implies a \$741.52 pre-print close.	YES
“Diluted shares −0.85% y/y”	Pack XBRL vintages	Red used 37,456,139 = 2023-07-31 as the year-ago figure. Correct y/y is 37.137M vs 37.352M = −0.58%	YES — red mis-vintaged
“SBC +37.9% y/y”	Pack XBRL vintages	15.221 vs 11.036 is FQ1- FY26 vs FQ1- FY25 — from the block red itself certified four quarters stale. FQ1-FY27 SBC is not in the pack at all.	YES — red mis-vintaged
Opex bridge and the 6:1 hedge ratio	$446.9 + (1,780 \times 0.422) - 485.1$	\$713.0M opex; card component \$9.9-10.7M; ratio 5.9:1	YES

Claim	How checked	Found	Confirmed?
Trailing multiple	635.925 / 19.16	33.19x	YES
Industry mid-cycle fuel margin	Public NACS/OPIS material	A NACS piece citing an OPIS weekly report gives an average fuel margin of “35.7 cents per gallon”; blue’s “~38¢ five-year average” is directionally right. Both benches’ 41¢ baseline is above the industry average. Our band: CASY mid-cycle 42-45¢ given scale and supply.	PARTIAL — direction confirmed, exact figure not matched
“FQ1-27 cash flow is unverifiable” (both benches)	Pack filing inventory	False as stated. The FQ1-27 10-Q was filed 2026-09-08, accession 0000726958-26-000085 . Only the pack’s <i>excerpt</i> is an empty XBRL context header. The statement is on EDGAR and drainable in minutes.	YES — shared error by both benches; it is a drain-queue item, not a coverage gap
Blue’s “PRIZE-TABLE MANDATE: N/A”	Checked against the rule	Overtaken. The mandate triggers on time-gated/private unverified items, not on pre-revenue status. Blue therefore set a HALF-STARTER without ever building an EV table ; ours puts EV 15.5% below spot.	YES — blue erred, and it changes the position
Fikes lap timing vs the FY26 raise	Deal close Nov-2024 → anniversary Nov-2025 vs the Q3-FY26 raise reported March 2026	Both benches overreached. The lap ran through roughly the first half of FQ3-FY26, so it could have funded part of that quarter but not a full-year guide. Red’s “REFUTED” is too strong; blue’s “cannot have funded” is too strong.	PARTIAL
Two-year stack decomposition	$7.7-3.2 = 4.5$; $6.7-4.5 = 2.2$	Arithmetic correct: the year-ago inside comp was 4.5%, so 3.2% is a decel on a hard base. Whether that is “damage” is a judgment, not a fact.	YES (arithmetic) / contested (inference)
Detector coverage	Compared the two bench lists	Red skipped four atlas lines blue consulted (carbon_mapper, chinese_smallcap_ramp_dump_archetype, clinical_trial_referral_quality, upc_tra_value_extraction). Three are trivial false positives; carbon_mapper over the Waco terminal is the highest-value unrun check in the case.	YES — red erred
Science brief present?	Inputs	SCIENCE BRIEF section is empty; CASY is not a deep-tech name. SCIENCE BRIEF DIGEST section omitted per rule (it is not applicable, not skipped).	YES

PROPOSED ENTRY BANDS

Spot: \$635.93. Immediate action: none. No order today.

Anchor for every level below: **fuel-normalized FY27 EPS $\approx$ \$18.85** (bear bench's \$16.3-16.8 at 41¢, corrected for the card-fee asymmetry to \$16.5-18.1, then set to a 43.5¢ mid-cycle margin at \$0.76/share per penny of full-year margin). Spot is $\sim$ 34x that. Sensitivity: **each 1x of multiple $\approx$ \$19 of price; each 1¢ of full-year fuel margin $\approx$ \$0.76 of EPS $\approx$ \$21 of price at 28x.**

Level	Price	Basis	Action	Cumulative size
L1 — half-starter	\$565	30x normalized \$18.85 — the <i>top</i> of the 25-30x compounder band the bear bench itself used	BUY	0.50% of book
L2 — add	\$497	52-week low retest (\$496.566, pack) $\approx$ 26.4x normalized	BUY	1.50% of book
L3 — final add	\$452	24x normalized; middle of the hard-reversion branch	BUY	2.50% of book
Gate release	up to \$600	only if $\geq$ 2 of the three release gates below confirm (which moves normalized EPS toward \$20.40, making \$600 $\approx$ 29x)	BUY	3.00% of book (full target)

Release gates (from the bull bench's own conditions): 1. FQ1-27 10-Q cash flow shows OCF minus capex $>$ 70% of net income; 2. A dated management statement or terminal-economics disclosure attributing $\geq$ **4¢ of the +6.8¢** to Fikes/Waco supply structure; 3. FQ2 inside same-store sales $\geq$ 3.5% **on the y/y basis** with fuel margin $\geq$ 43¢.

Trims and exits: - Hard flat, regardless of price: FQ2 fuel margin $<$ 42¢ **and** inside SSS $<$ 3.0% (the bull bench's own stop). Exit the whole line. - Cancel the entire ladder and reopen only at $\leq$ \$452 if the FQ1-27 10-Q shows OCF–capex $<$ 50% of net income. - Trim one-third at **\$700** (33x the bull-branch \$21.52), remainder at **\$735**. - Nothing is added above \$600 under any circumstance short of a full three-of-three gate confirmation.

Catalyst dates: - **2026-12-08 — FQ2 FY27 print. UNCONFIRMED** (yfinance-derived; no company press release in the pack's filing inventory names it). $\sim$ 62 sessions out, so the pre-print branch does not fire today. - **$\sim$ 2026-12-08/09 — FQ2 10-Q.** The FQ1 8-K and 10-Q were both filed 2026-09-08, so expect same-day or next-day pairing. - **Now — FQ1-27 10-Q, accession 0000726958-26-000085, already public.** Not a future catalyst; a drain-queue item both benches missed. - Weekly, no fixed date — EIA/OPIS retail fuel margin series. This is the running read on the single most load-bearing variable.

ARMED SENSORS

(armed provisionally with this deck; session adjudication ratifies)

- price alert: fires below 600.0 (deck-provisional: gate-release ceiling - buy final 0.50% only if $\geq$ 2 of 3 release gates confirm)
- filing watch: 8-K until 2027-03-09 (deck-provisional: FQ2 FY27 release and any guidance revision - carries fuel cpg and inside SSS, the two verdict variable)

- dated pack CASY|2026-12-08: CASY: FQ2 FY27 earnings print - resolves fuel cpg, inside SSS and the sandbag question in one event (date confirmed=False)
- dated pack CASY|2026-12-09: CASY: FQ2 FY27 10-Q expected (FQ1 8-K and 10-Q both filed same day, 2026-09-08) (date confirmed=False)
- dated pack CASY|2026-09-08: CASY: FQ1-27 10-Q already filed, accession 0000726958-26-000085 - cash flow statement is public and undrained (date confirmed=True)

What remains unverified

1. **FQ2-FY27 fuel margin (cents per gallon).** Time-gated to the 12/08 print. Estimate **42-46¢**, from the NACS/OPIS ~36¢ industry average plus Casey's scale/supply premium and the current elevated regime; $p(\geq 43¢) \approx 0.55$.
2. **How much of the +6.8¢ is structural (Fikes/Waco vertical supply) rather than crack-spread luck.** Private; requires management attribution or terminal economics. Estimate **1-3¢ structural**; $p(\geq 4¢) \approx 0.30$. This is the highest-value open item in the deck — it is worth roughly \$160 of price between branches.
3. **FQ2 inside same-store sales, y/y basis.** Time-gated. Estimate **2.6-3.8%** (FQ1 3.2% on a 4.5% comp, decaying comp difficulty); $p(\geq 3.5\%) \approx 0.35$.
4. **Street consensus for FQ2 fuel margin and FY27 EPS.** Draggable now via the broker/analyst feed; neither bench reached it. Estimate: consensus FY27 EPS **\$18.50-20.00**, i.e. above our \$18.85 midpoint but below the brief's implied \$19-21; $p \approx 0.6$.
5. **FQ1-27 operating cash flow minus capex as a percentage of net income. Draggable now** — the 10-Q is filed (accession 0000726958-26-000085); only the pack excerpt was empty. Estimate: OCF **\$380-420M** against ~\$150-175M quarterly capex on a ~\$600M/yr unit-growth program → conversion **70-90%**; $p \approx 0.6$.
6. **Peer relative multiple.** Draggable now via market data. Estimate: c-store/fuel-retail peers **17-24x forward**, implying CASY carries a 40-60% premium; $p(\text{premium} > 30\%) \approx 0.70$.
7. **Transaction codes in the ten Form 4s dated 2026-09-04.** Draggable now from EDGAR document bodies. Estimate: $p \approx 0.85$ that these are code-A annual grants under the 2025 Stock Plan (approved 2025-09-03) plus code-F tax withholding, with no open-market purchases.
8. **Whether 2026-12-08 is a company-confirmed print date.** Draggable now from IR/8-K. Estimate: $p \approx 0.80$ the date holds within ± 2 sessions.

PRIZE TABLE + VOL READ

Triggered because items 1-3 above are genuinely time-gated or private. (This overturns the bull bench's "PRIZE-TABLE MANDATE: N/A" — that ruling applied a pre-revenue-developer test, but the trigger is time-gated unverified items, and consequently the bench set a HALF-STARTER with no EV arithmetic behind it.)

Anchor and adjust. Anchor = fuel-normalized FY27 EPS \$18.85 at a 43.5¢ mid-cycle margin. Adjust each branch by margin ($\pm \$0.76/\text{share}$ per penny) and by multiple.

#	Scenario	p	Normalized FY27 EPS	Multiple	Price
A	Mid-cycle revert (43.5¢), inside box intact, no re-rate	0.35	\$18.85	28x	\$528
B	Structural leg partly real (45.5¢ holds via Waco supply)	0.25	\$20.38	30x	\$611
C	Full structural (47¢) + inside comp re-accelerates above 4.5%, multiple restored	0.13	\$21.52	33x	\$710
D	Hard reversion (41.5¢) with inside SSS <3%	0.22	\$17.33	24x	\$416
E	Peer-multiple compression / consumer break	0.05	\$16.95	19x	\$322

EV = \$537.5 versus spot \$635.93 $\rightarrow$ -15.5%. That is the whole reason there is no immediate entry. EV crosses spot only if you believe branch B+C together exceed ~55% probability, which requires believing the Waco structural story before anyone has checked it.

Dispersion. $\sigma_{\text{table}} = \104 , i.e. 19.4% of EV. Over the 62-session ($T = 0.246y$) horizon to the print that is an implied annualized dispersion of ~**39%**; over a 1-year horizon, ~**19%**.

Bimodality — the table is fork-dated on 2026-12-08. The mass splits into a low cluster (\$322-528, $p = 0.62$) and a high cluster (\$611-710, $p = 0.38$), with a gap between \$528 and \$611. A single lognormal vol read will misprice this. **62% of the distribution sits below our first entry band of \$565**, which is the arithmetic reason the ladder starts there rather than at spot.

Expression math — and why it cannot be completed. There is no options chain in the evidence pack. No IV, no IV percentile, no realized-vol series (the pack carries no price history), therefore no VRP. Per the TSSI lesson (aggregate feed 71 vs chain 101), we will not substitute an underlying aggregate IV feed for chain-level midpoint IV — that is exactly the error that turns a vol trade into a coin flip. What we *can* do is price the table side of the comparison now, so the desk only needs one chain pull to finish it:

- **$C_{\text{ours}}(K=650) = \sum p_i \cdot \max(S_i - 650, 0) = \7.80 .** Only branch C finishes above 650. Any realistic 650 call on a \$636 S&P 500 name costs many multiples of that. **Long calls fail the table by a wide margin — not close, no chain needed.**
- **$C_{\text{ours}}(K=600) = \17.11 .** Also almost certainly below any real quote.

- **$P_{ours}(K=500) = \sum p_i \cdot \max(500 - S_i, 0) = \27.36** . This is the one that could work: if a Dec/Jan 500-strike put bids **above \$27.36** at the chain midpoint, selling it is the paid way to express “we want the L2 band,” because we are being compensated for a fill we already want at a level we already chose.
- **$P_{ours}(K=550) = \$48.58$** — same logic at the L1 band, but assignment probability is 62%, so treat it as a stock-entry substitute, not a premium harvest.

Instrument recommendation, as the output of the arithmetic above: COMMON STOCK at the ladder levels — and nothing else until a chain is pulled. Long calls are eliminated by the table itself (\$7.80 fair value at the 650 strike). Covered calls are unavailable (no position). Cash-secured puts at \$500 are *conditionally* recommended and become the preferred L2 expression **if and only if** the chain-level midpoint bid exceeds \$27.36; that gate cannot be resolved from this pack, which is why the chain snapshot is on the missing-sensor list.

TAX overlay. The loss branch must land in the intended tax year. The only catalyst that resolves this thesis is 2026-12-08. A **2026-12-18 expiry** captures the print and lands any loss in TY2026, keeping it harvest-eligible. Any January-2027-or-later expiry pushes the loss past December 31 and is **excluded during a harvest year unless the edge numerically dominates** — and here it plainly does not: $C_{ours}(650) = \$7.80$ against any real chain price is negative edge before tax, so the deferral question never arises for long calls. For the conditional \$500 cash-secured put, use the **2026-12-18** expiry so that assignment establishes a TY2026 basis and any buy-back loss books in 2026. No wash-sale interaction exists today because we hold no CASY and have realized no CASY losses.

```
