

PITCH — CLPT — VERDICT

ADJUDICATED 2026-09-16 — WATCH — band \$8.75 (conviction 7/10). The court found nothing to own at this price; the reopen gates below are the only path back.

(No SCIENCE BRIEF was supplied in the inputs — the brief block is empty — so the SCIENCE BRIEF DIGEST section is omitted per its own trigger condition. If a brief is later attached to this name, this deck must be re-issued with the digest before any size goes on.)

What we believe

ClearPoint Neuro sells the hardware, disposables and service work that let other people do brain surgery and deliver drugs into the brain — including the delivery step for other companies' gene therapies. We believe the *business* is real and the *stock* is not cheap.

Three beliefs, plainly:

1. **The company is not about to run out of money.** At 6/30/26 it had about \$29.4M of cash and was burning roughly \$7.5M a quarter, which alone is under four quarters. But the 2025 note agreement with Oberland still contains an **undrawn \$25.0M tranche that the company can take at its own option any time before 12/31/26** — a company decision, not a negotiation. That pushes practical runway to roughly seven quarters *if they pull it*. This is the one place our own red bench got it badly wrong (see the checked-ourselves table).
2. **The price already assumes the good version of the story.** At \$14.05 with ~30.5M shares, the equity is ~\$429M and, adding ~\$55M of notes and netting ~\$29.4M of cash, enterprise value is ~\$454M — **about 9.1x the midpoint of a revenue guide the company just cut to \$48–52M**, and ~12.3x actual FY25 revenue of \$37.0M.
3. **The next three months are a guide-versus-print test, not a story test.** Guidance implies H2 revenue of \$25–29M, i.e. \$12.5–14.5M per quarter, against \$10.88M in Q2. Our own quarterly estimate is \$11.0–12.0M — below the guide-implied floor even though it would print as +24–35% growth versus a soft year-ago quarter. That combination (headline growth, missed guide) is how this name can look fine and still de-rate.

Net belief: **right business, wrong price, and the cheap-money leg of the bear case is dead.** We want it lower, or we want proof the demand is booked rather than merely possible.

What the market believes

- The sell side carries a Buy and a **\$30.00 target** — roughly double the tape — and Morningstar publishes a price/sales of about 9.9. So the multiple we are calling expensive is not a secret we discovered; it is a published, consensus-visible number. Our red bench labelled this a “novel” kill and that label was wrong.

- The market believes the H2 inflection happens. Consensus for the June quarter was \$13.0M against \$10.88M actual — a **16.3% miss** — and the name has beaten on revenue only once in the last four quarters. The full-year street number of \$53.1M (dated 7/18/26) sat *above* the new \$48–52M guide, but that print is **pre-cut and therefore stale**; post-print consensus almost certainly resets near the guide. Anyone still quoting “street above guide” as evidence of complacency is using a dead anchor.
- The tape says the panic is over: down 53.3% from the 52-week high of \$30.10, but **up 69.9% from the \$8.27 low**. The market has already re-rated this once, upward. Buying “a 53% drawdown” here is buying a bounce that has mostly happened.

Why we might have edge

1. **We decomposed the guide instead of accepting it.** The H2 ask (\$12.5–14.5M/qtr from \$10.88M) is a **\$1.6M–\$3.6M sequential jump**. The best organic sequential gain in company history is roughly **+\$0.5M** — and the seasonality check kills the obvious rescue: reported Q4’25 rose ~\$1.5M sequentially, but the company’s own January 8-K said the 20% comparable growth *excluded* IRRflow, which backs organic Q4’25 into ~\$9.3M, i.e. ~+\$0.44M organic sequential. There is no reliable fourth-quarter seasonal lift, and 2024’s fourth quarter actually fell sequentially.
2. **We have a gradeable number.** Our \$11.0–12.0M versus the guide-implied \$12.5–14.5M is a specific, dated, falsifiable disagreement — and the mechanism is named: consensus and guidance both assume the biologics/drug-delivery line inflects on service work that is *capacity*, not *backlog*. The filing discloses no backlog for that segment and contract-liability releases of only ~\$0.7M a quarter.
3. **Guide credibility is measurable and deteriorating.** Combined guidance went **\$54–60M (11/6/25) → \$52–56M (3/17/26) → \$48–52M (8/3/26)** — two cuts inside two quarters of setting the number. That is a stronger argument against management’s “return to growth in the third quarter” line than any modelling we can do.
4. **We priced the upside instead of gesturing at it.** A 50% move to **\$21.08** implies ~\$668M enterprise value, which needs **~\$73M of revenue at today’s 9.1x**, ~\$111M at 6x, ~\$67M at 10x — a 2028-ish number at guided growth. The roof isn’t in the room.
5. **A leak in the enterprise value nobody was modelling:** the IRRAS earnout runs over three one-year periods at **25% of net sales** of certain acquired products above thresholds. The inorganic revenue carrying the “18% growth” headline arrives with a contingent claim attached, so the true sales multiple is worse than 9.1x.

Why it might be priced in

Honestly: most of it.

- The 9.9x sales is **published**. The Buy/\$30 target is published. The guide cut is public. The 16% miss is public. Four of the five surviving arguments are consensus-class, not novel. Post-audit tally on the bear case was **1 novel finding / 4 consensus / 2 overturned**.

- The financing scare — the part that would have made this a real dislocation — **isn't true**. The tranche is undrawn and unilateral.
- The one thing our work is genuinely early on (that the H2 sequential ask exceeds anything the company has ever done organically) is reduced, not confirmed: we applied a first-quarter IRR flow revenue figure to the second quarter, where it is **not disclosed**, so “organic –7%” is *plausible*, not proven. And the year-ago comparison contains a management-acknowledged one-time single-customer order, which flatters our own decomposition.
- The bear case is a **valuation and pace** case. Valuation cases do not pay on a schedule; they can be wrong for a year while a partner headline re-rates the multiple. Which is exactly why we are flat rather than short.

What could go wrong

(the PRE-MORTEM, v1.7)

Failure narrative 1 — the cheap price arrives with a cheaper business (tripwire: YES). We buy the \$8.50–9.00 reopen band, and the reason it got there is a fourth guide cut. Revenue resets to \$42–45M and “5x sales” recomputes to 6.5x on the new number — the multiple never actually compressed, the denominator fell. *Monitorable*: any guidance 8-K/PR, and the quarterly print itself. This is the single most likely way we lose money, because our entry rule is written in multiples and multiples move when the denominator does.

Failure narrative 2 — the tranche is not the free option we think (tripwire: PARTIAL). The \$25M is described as a company option, but **neither bench read Note 8 or the note-purchase-agreement exhibit** (blue hit a 403; red inferred from a cumulative-proceeds line). If there is a material-adverse-change clause or a minimum-revenue condition precedent, the option evaporates exactly when it is needed, and the next dollar is the untouched **\$50M at-the-market program into a ~30.5M-share float** — ~12% of market cap of issuance sitting above the tape. *Monitorable*: an 8-K, a 424B5, or the next 10-Q — but only *after* the fact. Pre-event, this is unreadable until we fetch the exhibit.

Failure narrative 3 — the partner-side reversal, WITH NO MONITORABLE TRIPWIRE. ClearPoint's biologics revenue is a derivative of other companies' private go/no-go decisions on brain-delivered therapies. A partner can quietly deprioritise a program in an internal portfolio review, or a safety signal in someone else's trial can freeze the whole delivery approach class-wide, and **nothing files, nothing scans, nothing prints**. There is no backlog disclosure, no referral-quality data (that detector was unusable here — the company is the supplier, not the referrer), no trial-registry read on a supplier, and no satellite or facility read that separates “possession of a building” from “booked work.” We would learn about it two or three quarters later as service revenue that simply failed to renew. **Unknown-unknown class: counterparty-internal capital-allocation reversal at a private third party — silent partner attrition in a supplier-of-record with no disclosed backlog**, with an adjacent sub-class of *off-tape scientific reversal* (a class-wide safety event at a sponsor we don't cover). We cannot arm a sensor for this. We can only cap size against it.

The reflexive / structural leg (our own size, predicted flow, doctrine interactions): - **Liquidity:** ~726k shares/day at ~\$14 ≈ **\$10M of average daily volume**. A 0.5%-of-book starter is comfortably inside a day for us; the problem is the exit, not the entry — in a post-miss tape this name’s volume concentrates and the spread widens, so anything above ~1 day’s volume should be treated as a multi-day unwind and sized accordingly. - **Predicted flow against us:** the \$50M at-the-market program is the structural ceiling. Any bounce is the issuer’s best window to sell, so our upside path has a seller in front of it. Insider Form 4s (six on 7/01–7/06/26, one on 9/03/26) plus 144 notices (6/17, 6/29/26) plus 1.325M shares issued in the IRRAS deal add supply, though the July cluster is consistent with the annual grant/vest window and the 144 amounts are unverified — this is supply *context*, not a kill. - **Doctrine interactions:** we nearly lost money to our own process here. The **stale-dislocation error class** almost got us long a “–53%” name that is +70% off its low. Two detector patterns fought each other on the financing question — *committed_tranche_exhaustion_diff* (red: reconcile announced tranches to cumulative proceeds) fired and produced a false kill, and *tranche_identity_misattribution* (blue: force the net/gross ratio to choose between candidate tranche sums; 87% smells wrong, 96% is fee-consistent) corrected it. Both must be armed as a **pair**, never singly, or the same error recurs. Separately, the evidence pack’s own coordinate for the “San Diego Facility” (32.71742/–117.16277, downtown) is **not** the Torrey Pines parcel the thesis leans on (~32.90/–117.24) — any imagery scan run on the pack geocode would have tested the wrong building and returned a confident, wrong answer.

If this position loses money, the most likely reason will be that we bought a multiple, not a business: we paid ~9× a twice-cut revenue guide for a device company whose organic base was flat-to-shrinking, the third cut came before the inflection did, and the “cheap” level we waited for turned out to be the same multiple on a smaller number.

What we checked ourselves

Claim	How checked	Found	Confirmed?
Evidence pack’s quarterly XBRL is usable for revenue/burn math	Compared pack series to the 6/30/26 10-Q and 8/3/26 8-K exhibit	Pack series is one year stale (latest revenue row 2025-06-30). Both benches independently flagged it and superseded it	NO — pack error, superseded
Tape anchor \$14.05	Live quote rail vs pack	\$14.31 close 8/29/26, \$14.90 on 9/1/26 — tape ran 2–6% above the pack anchor; all band math below is stated on the pack anchor and must be re-based at execution	NO — pack anchor stale

Claim	How checked	Found	Confirmed?
52-week range 8.27 / 30.0999; –53.3% drawdown; +69.9% off low	Third-party range check (Morningstar, 8/29/26)	Matches	YES
“The \$25M Oberland option is already spent; next dollar is the ATM” (RED’s headline kill)	Blue pulled the FY25 10-K MD&A: sec.gov/Archives/edgar/data/1285550/000119312526111231/clpt-20251231.htm	An amendment for \$20.0M of the Third Tranche at the IRRAS closing. So \$30M + \$20M = \$50M gross → \$48.1M net = 96.2% , fee-consistent. Red’s assumed \$55M gross implied 12.5% costs — an arithmetic tell it dismissed. The \$25M company-option tranche is undrawn and unilateral to 12/31/26	NO — OUR OWN RED BENCH WAS WRONG, and it was its “strongest single kill”
\$48.1M net proceeds from two notes	10-Q MD&A liquidity, primary: clpt-20260630.htm	Confirmed as written; the inference <i>layered on top of it</i> was the error, not the quote	YES (quote) / NO (inference)
Enterprise value ~\$454M = 9.1× guide midpoint	Recomputed: 30.5M × \$14.05 = \$428.5M; +\$55M notes –\$29.4M cash = \$454.1M; ÷ \$50M = 9.08x ; ÷ \$37.0M FY25 = 12.3x	Confirms. On blue’s verified 29,989,563 shares (5/7/26) it is \$447M / 8.94x — we use the 30.5M version as the conservative one	YES
“This is a novel valuation kill”	Cross-checked against published data	Morningstar prints P/S 9.9; street carries Buy / \$30.00 target. The multiple is consensus-visible	NO — kill-class mislabelled by our red bench; reclassified CONSENSUS

Claim	How checked	Found	Confirmed?
Reopen level “EV/S $\leq 5\times \approx$ \$8.50–9.00”	Re-ran the arithmetic ourselves	\$9.00 is exactly 6.0x and \$8.50 is $\sim 5.8\times$. True 5.0x is \$7.36. Both benches quoted the band and the multiple as if they matched; they don't	NO — arithmetic error present in BOTH benches; corrected in the bands below
“+50% needs ~\$73M revenue”	$\$14.05 \times 1.5 = \$21.08 \rightarrow \text{EV } \$668\text{M}; \div 9.1 = \$73.4\text{M}, \div 6 = \$111.4\text{M}, \div 10 = \66.8M	Confirms exactly	YES
Organic revenue ex-IRRFlow –7% y/y	Blue audited red's decomposition	Red applied the first-quarter $\sim \$2.3\text{M}$ IRRFlow figure to the second quarter, where it is undisclosed; also the year-ago comp holds a non-recurring single-customer order	NO — downgraded to PLAUSIBLE, not confirmed
Company hid its organic base (multi-venue disclosure kill)	Compared the PR, the call, and the 10-Q	The same PR discloses “18% overall growth, including the recently acquired IRRFlow Portfolio” and a 15% biologics decline; the January 2026 8-K published an explicit ex-IRRFlow comparable. A company that hands you the exclusion has not hidden it. Guidance living in a PR and not a 10-Q is venue-normal	NO — detector FIRED then was overturned on audit
Street FY26 \$53.1M sits above guide	Date-checked the consensus print	Dated 7/18/26 — pre-cut . Stale anchor; consensus resets near guide post-print	NO — corrected

Claim	How checked	Found	Confirmed?
Three guide cuts in nine months	Primary PRs: \$54–60M (11/6/25) → \$52–56M (3/17/26) → \$48–52M (8/3/26)	Confirmed	YES
IRRAS earnout dilutes the revenue we're paying for	10-K deal terms	Three one-year periods at 25% of net sales above thresholds — EV/sales is understated	YES (structure) / thresholds unverified
Runway	\$29.4M cash ÷ ~\$7.5M/qtr = ~3.9 quarters pre-capex; +\$25M undrawn unilateral tranche ≈ ~7 quarters, gated on a company decision ; Torrey Pines fit-out capex not in that number	Confirmed	YES
Short interest 2.35M shares / 8.25% of shares out	Source date check	2025-vintage page — stale, current level unknown	NO
Print date 2026-11-05	Searched for a company PR naming it	None found. Pattern only (the year-ago quarter printed 2026-11-06 per third-party). ~41 trading days out — no catalyst race	NO — UNCONFIRMED
Facility-imagery read on the Torrey Pines site	Detector review	Pack geocode points at downtown San Diego , not the relevant parcel; and even aimed correctly it tests possession (already in the lease note), not booked work	NO — would have tested the wrong parcel
A New Mexico permits detector was consulted	Bench log review	No New Mexico nexus exists for this issuer — dispatch artifact , i.e. a detector was run on the wrong company's geography	NO — process error, zero informational value
Blue bench read the primary documents directly	Bench self-disclosure	Blue had no page-fetch capability — reads were search-surfaced primary text, and Note 8 sat behind a 403.	PARTIAL

Claim	How checked	Found	Confirmed?
		Stated, not hidden, but it is a real coverage gap	

PROPOSED ENTRY BANDS

Both benches say NO ENTRY. We are flat with no orders and we recommend staying flat.

What follows are the **reopen bands** — nothing is worked until one triggers. All prices are on the pack anchor of \$14.05 and the 30.5M-share/\$55M-notes/\$29.4M-cash structure; **re-base at execution, because the live tape was already 2–6% above the anchor.**

Reopen A — price (valuation gate). The guide must be intact (\$48–52M, no fourth cut). - **\$9.00 = 6.0x enterprise value/sales — WATCH only, no order.** This is the level both benches wrote down; note plainly that they mislabelled it as 5x. - **\$8.50 (≈5.8x) — starter, 0.5% of book.**

Requires: guide reaffirmed at the prior print, and no at-the-market issuance disclosed above 2% of shares outstanding. - **\$7.36 = true 5.0x — add, +0.5% of book** (total 1.0%). This is the arithmetic 5x line, not the bench-quoted one. - **Thesis-void / no-average-down floor: a fourth guide cut, or at-the-market issuance above 5% of shares outstanding at any price.** In either case the multiple math is being recomputed on a falling denominator (pre-mortem #1) and the bands are withdrawn, not lowered.

Reopen B — event (proof-of-demand gate). Both legs required, not either: - an **8-K drawing the \$25.0M Second Tranche on non-dilutive terms** (no repricing, no warrants, no new equity-linked feature), **AND - quarterly contract liabilities + accounts receivable up ≥\$3M sequentially**, or a signed multi-year service agreement 8-K **with dollar amounts** — booked demand, not capacity. - If both land: **starter 0.5% of book, payable up to \$15.50 and not above.**

No-touch above: \$15.55 = 10.0x EV/sales on the unchanged guide. Above that, the long is closed to us regardless of news; the roof at \$21.08 requires ~\$73M of revenue at today's multiple.

Trims/exits (if ever long): trim half at \$18.00 (~11.6x guide) absent a revenue number above \$60M; exit in full on a fourth guide cut, on any dilutive financing, or if two consecutive quarters print below the guide-implied floor.

Catalyst dates: 2026-11-05 third-quarter print — *UNCONFIRMED, yfinance-derived, no company PR names it*; treat the window as 11/04–11/12. **2026-12-31** — the last day the company can exercise the \$25.0M option unilaterally; letting it lapse silently is itself information. **2026-12-19** — December option expiry, i.e. the last expiry whose loss lands in tax year 2026. **~2027-01-12** — preliminary full-year revenue 8-K (pattern only; the January 2026 8-K is the precedent, and it is where the ex-acquisition comparable was published).

ARMED SENSORS

(armed provisionally with this deck; session adjudication ratifies)

- price alert: fires below 7.36 (deck-provisional: true 5.0x EV/sales on our recompute - add +0.5% of book)
- filing watch: 8-K until 2027-03-06 (deck-provisional: draw on the 2025 note purchase agreement - \$25.0M Second Tranche, terms parsed for repricing/warrants;)
- dated pack CLPTI2026-11-05: CLPT: Q3 2026 print - our \$11.0-12.0M vs guide-implied \$12.5-14.5M floor; yfinance-derived date, no company PR names it (date confirmed=False)
- dated pack CLPTI2026-12-19: CLPT: December option expiry - last expiry whose loss branch lands in tax year 2026 (date confirmed=True)
- dated pack CLPTI2026-12-31: CLPT: last day the company can unilaterally exercise the undrawn \$25.0M Second Tranche; a silent lapse is itself information (date confirmed=True)
- dated pack CLPTI2027-01-12: CLPT: preliminary FY2026 revenue 8-K - the venue where the ex-IRRFlow organic comparable was published last year (pattern only) (date confirmed=True)

What remains unverified

Genuinely open only — anything already drained or estimated sits in the checked-ourselves table with its disposition.

1. **Conditions precedent on the undrawn \$25.0M Second Tranche** (material-adverse-change or minimum-revenue clause?). Neither bench read Note 8 or the note-purchase-agreement exhibit. **Drainable now** — direct EDGAR archive fetch of the 6/30/26 10-Q Note 8 plus the 2025 agreement exhibit. This is the single highest-value drain in the deck: it is the difference between ~7 quarters of runway and ~4.
2. **Third-quarter revenue versus the guide-implied floor of \$12.5–14.5M.** Not drainable — private until the print. **Estimate \$11.0–12.0M**, probability of landing below the guide-implied floor ≈ 0.65 .
3. **Sequential change in contract liabilities and accounts receivable.** Not drainable until the filing. **Estimate +\$0.5M to +\$1.5M sequential**, probability of the $\geq \$3M$ gate clearing ≈ 0.20 (releases have been running $\sim \$0.7M/qtr$).
4. **Organic revenue excluding the acquired IRRFlow line, for the June and September quarters.** Not disclosed. **Estimate IRRFlow \$2.0–2.6M/qtr**, implying organic \$8.3–8.9M; probability the organic base is flat-to-down year over year ≈ 0.65 .
5. **Whether Oberland will consent to the ~\$30M Third Tranche residual if the \$25M proves insufficient.** A private counterparty decision. **Estimate probability of consent within 12 months if requested ≈ 0.50** , base-rated off royalty/revenue-interest lenders continuing to fund performing but slow-ramping medical-device borrowers.
6. **Current short interest and borrow cost.** **Drainable now** — exchange/FINRA semi-monthly file plus the broker borrow screen. The 2.35M-share / 8.25% figure in circulation is 2025-vintage.
7. **Share counts and dollar values on the 144 notices (6/17, 6/29/26) and the seven Form 4s (7/01–7/06, 9/03/26).** **Drainable now** — parse the filings themselves rather than the index.
8. **Confirmation of the third-quarter print date.** Not drainable until the company issues a PR. **Estimate 2026-11-04 to 2026-11-12**, probability the 11/05 pack date is correct ≈ 0.55 (pattern: 11/05)

the year-ago quarter printed 11/06).

9. **Chain-level midpoint implied vol and real bid/ask for the December and January \$15 calls. Drainable now** — broker chain pull. Required before any gated add is expressed in options.
10. **IRRAS earnout thresholds and the resulting dollar leakage on acquired-product sales. Drainable now** — the business-combination and contingent-consideration notes in the FY25 10-K; if the thresholds are redacted, fall back to **estimate: 25% of \$8–10M of annualised acquired-product sales above threshold $\approx$ \$1.0–2.0M/yr of economic leakage**, probability material to EV/sales $\approx$ **0.60**.
11. **Exact shares outstanding as of the most recent practicable date.** Verified at 29,989,563 as of 5/7/26; the 30.5M used here is a conservative roll-forward. **Drainable now** — the cover page of the next 10-Q.

PRIZE TABLE + VOL READ

Required here because items 2, 3, 4, 5 and 8 above are genuinely time-gated or private. Anchor-and-adjust: the anchor is today's \$14.05 = $9.1\times$ a just-cut guide, and every branch below is an adjustment off that multiple, not off a story.

Scenario	What happens	Prob.	Price
Bear — the fourth cut	Q3 prints \$11–12M, guide cut again, multiple compresses to $\sim 6\times$ on a smaller number; ATM tapped	0.40	\$8.50
Base — muddle	Q3 $\sim$ \$12M, guide narrowed to the low end, \$25M tranche drawn cleanly, multiple roughly holds	0.35	\$13.50
Bull — proof of booked demand	Q3 in-band, contract liabilities/AR $\geq$ \$3M, tranche drawn non-dilutive, guide reaffirmed	0.18	\$18.00
Blue-sky — partner re-rate	A partner regulatory/BLA event re-rates the drug-delivery optionality; multiple expands, not just revenue	0.07	\$26.00

EV line: $0.40\times 8.50 + 0.35\times 13.50 + 0.18\times 18.00 + 0.07\times 26.00 = \13.19 — **about 6% BELOW the \$14.05 anchor.** The table itself, not an opinion, is why this deck is a no-entry. Note the bull and blue-sky branches carry only 25% combined weight and still cannot lift expected value above the tape — that is what “no roof” looks like in arithmetic.

Dispersion: standard deviation of the table is **\$4.95 = 35.2% of spot** over a horizon of roughly one quarter to the December expiry ($T \approx 0.28$ years), which annualises to about **67% implied-equivalent vol**. So *our own view is that $\sim 67\%$ vol is fair*. Anything the chain offers meaningfully below that would make optioned exposure the efficient way to express a gated add; anything above routes to the premium-selling gates instead.

Expression math, priced off the table itself: - $C_{ours} = \sum p_i \times \max(S_i - K, 0) - K = \$15.00 \rightarrow 0.18 \times \$3.00 + 0.07 \times \$11.00 = \$1.31 - K = \$17.50 \rightarrow 0.18 \times \$0.50 + 0.07 \times \$8.50 = \$0.69 - K = \$20.00 \rightarrow 0.07 \times \$6.00 = \$0.42$

Chain comparison: NOT AVAILABLE — no options chain was supplied in the evidence pack and neither bench pulled one. That is unverified item 9, and it is a hard blocker on any option recommendation. When it is pulled it must be the **chain-level midpoint implied vol and the real bid/ask on the specific strike**, never the aggregate underlying vol feed — those two diverge badly (the TSSI lesson: 71 on the chain versus 101 on the feed; acting on the feed would have inverted the trade). Decision rule, written now so it cannot be fudged later: if the December \$15 call mid is **materially below \$1.31** and chain midpoint vol is **below ~55%**, a Reopen-B add may be expressed in calls; if the mid is at or above \$1.31, or chain vol is above ~67%, the correct instrument is **stock at the price band or nothing**, and any premium selling is confined to cash-secured puts struck at or below the \$7.36 true-5x add line. **Volatility risk premium (implied minus realised) cannot be computed without the chain — stated as unknown, not assumed.**

Bimodality: the table is fork-dated on two events — the ~11/05 print (unconfirmed) and the 12/31/26 tranche-option expiry — so the distribution is **two-humped, not bell-shaped**. A single implied-vol number will misprice it in both directions: at-the-money straddles look expensive relative to the humps while wing calls look cheap. This is a specific argument against naked premium selling around the print and in favour of defined structures if we ever go there.

Tax overlay: treating 2026 as a harvest year, the loss branch must land inside 2026. Only the **December 19, 2026** expiry does that; a January or February 2027 expiry defers the loss into the following tax year and is therefore **excluded** unless the edge numerically dominates the deferral cost. It does not here — expected value is already ~6% below spot before any premium is paid.

Instrument recommendation, as the output of the arithmetic above: NONE. No stock, no calls, no covered calls, no cash-secured puts. Expected value is below spot, the roof needs ~\$73M of revenue, the chain is unpulled, and the only tax-eligible expiry is seven weeks after an unconfirmed print date. Revisit when a reopen band triggers *and* the chain has been pulled.

ADJUDICATION — 2026-09-16 15:36Z

EV/guide 9.1x a twice-cut \$50M revenue guide with no cushion; +50% needs ~\$73M revenue.

REOPEN GATES: 8-K drawing the \$25M second tranche on non-dilutive terms + Q3 contract liabilities/AR $\geq$ \$3M q/q; OR EV/S $\leq$ 5x (~\$8.50–9.00) with guide intact
