

GLXY pitch deck

The full court record is in hand — both benches, the evidence pack, and the unanimous no-entry disposition. Writing the deck now; no additional lookups needed since the courts already ran the sourcing and both benches were blocked from the same live feeds (noted in the deck as gaps).

PITCH — GLXY — PROPOSED VERDICT (PROPOSED — PENDING ADJUDICATION)

PROPOSED — PENDING ADJUDICATION: Do not buy today. Both benches independently reached “stay flat” ahead of CoreWeave’s earnings tomorrow (Aug 11, 5:00 PM ET). But this is a re-examine, not a kill: the case comes back to court after CoreWeave reports and after we read the actual bond documents. Reopen conditions below.

What we believe

Galaxy Digital is two businesses wearing one stock ticker. The first is a crypto trading and asset-management franchise. The second — and the reason this case exists — is Helios, a giant data-center campus in Dickens County, Texas, being built and leased to a single customer: CoreWeave, an AI cloud-computing company.

The original pitch was that the market is pricing Galaxy as a crypto company in a crypto downturn (the stock is down 57% from its high of \$45.92, trading around \$19.50–19.85), while ignoring that a large, contracted, rent-paying data-center business is switching on underneath it. CoreWeave has committed to lease the full ~800 megawatt approved campus on a roughly 15-year lease averaging over \$1 billion per year, with CoreWeave bearing most operating costs — a finding our second bench added that neither the original brief nor the first bench had fully credited. Phase I (133 MW) has been delivered; a much larger Phase II is under construction, funded by \$3.507 billion of newly issued bonds ([pricing press release](#)) plus a separate \$1.4 billion construction loan for Phase I ([press release](#)).

What we now believe, after the court fight: the data-center story is real but it is **entirely a bet on CoreWeave staying solvent**. In the near term, owning Galaxy stock is close to owning CoreWeave’s credit risk with extra steps. CoreWeave is visibly distressed — credit markets imply roughly 50% odds of default within five years, and a recent \$2.6 billion financing attempt failed to find buyers. CoreWeave reports earnings tomorrow. Buying the day before that report, with none of our monitoring in place, is not a trade — it’s a coin flip.

What the market believes

The market is treating Galaxy primarily as a crypto company caught in a crypto drawdown, with a growing discount for the CoreWeave concentration. The stock fell only about 5% on Galaxy’s own second-quarter results (Aug 5), and has already bounced roughly 19–21% off its 52-week low of \$16.43

— so the “nobody has noticed the data center” version of the story is at best only partially true. Some of the dislocation has already been bought.

The market cap is roughly \$7.8 billion (391.4 million shares). Against that: about \$7.2 billion of total debt after the new bond deal, and \$2.459 billion of cash — of which roughly \$1.6 billion appears to be held in stablecoins, meaning even the cash cushion carries crypto-infrastructure risk (this split is from a secondary source and not yet confirmed against the filing itself).

Why we might have edge

1. **The bond structure is more protective than the bear case claimed.** Our own first bench tried to kill this name on the argument that the new bonds’ ~\$487M/year of debt service swamps the ~\$320M/year of Phase I rent. The second bench showed this was an accounting error: Phase I rent services Phase I’s *separate* \$1.4B loan, the new bonds pre-funded their own interest reserve out of the proceeds, and principal repayment doesn’t begin until at least 10 months after Phase II is finished. When Phase II turns on, contracted rent should exceed the bond coupon. The strongest public bear argument in circulation (e.g. the [\\$346M coupon math](#)) makes a version of this same silo mistake.
2. **The contracted base is bigger than either bench initially credited.** CoreWeave’s commitment covers the full 800 MW approved campus; the “830 MW unleashed” figure floating around refers to *additional, newly approved* capacity beyond that.
3. **The bonds are largely walled off from the parent.** The notes are obligations of the project entity, secured by the project’s assets — not a general claim on Galaxy. If the project fails, Galaxy’s direct loss is its completion obligation plus its equity in the project (~15% of cost), not the \$3.5B principal.
4. **There is a defined research path to an answer.** The remaining questions (does the parent guarantee survive if CoreWeave walks away? how big is the pre-funded reserve? does the Phase I loan cross-default?) are answerable by reading the bond offering documents. That is cheap, decisive work.

Why it might be priced in

- The stock has already bounced ~20% off its low, and dropped only 5% on its own earnings — the market is not asleep on this story.
- The bull case’s central premise — that Galaxy trades with a crypto peer group rather than a data-center peer group — was **never verified**. The comparison data we needed was inaccessible to both benches. The original 8-out-of-10 conviction score rested on this unverified premise; by the brief’s own sensitivity math, if it’s wrong the score drops to ~4.
- The real risk transmission isn’t the coupon math the bears cite — it’s (a) an uncapped parent guarantee obligating Galaxy to *finish building* Phase II for a possibly-defaulting tenant, and (b) the Phase I loan maturing around 2028, which must be refinanced against whatever CoreWeave’s credit looks like then. Neither has a visible floor price attached today.

- CoreWeave reports in ~24 hours. Whatever edge exists is dominated, right now, by a binary event we have no differentiated view on.

What we checked ourselves

Claim	How checked	Found	Confirmed?
“New bonds’ ~\$487M/yr debt service vs ~\$320M/yr rent = money-losing project” (our first bench’s kill shot)	Both financing press releases, read against each other	Our own bench erred: it serviced one phase’s debt with another phase’s rent. Separate loans, pre-funded interest reserve, principal holiday until after completion	NO — overturned; reduced to a sizing concern
“Uncapped parent guarantee means Galaxy is on the hook for the \$3.5B” (first bench)	Pricing release (primary) vs a flagged AI-generated summary	Partly a bench error: the uncapped guarantee is real but covers <i>finishing construction</i> , not repaying the bonds; the bonds are project-level only	PARTIAL — guarantee confirmed, characterization corrected
Whether the guarantee survives if CoreWeave’s lease terminates; reserve size; cross-default terms	Attempted — needs the offering memorandum	Not obtained; SEC site blocked both benches (access errors)	NO — the decisive open item
CoreWeave earnings date Aug 11, 5PM ET	CoreWeave’s own scheduling press release	Confirmed	YES
Galaxy’s next earnings ~Oct 20 (data-feed date)	Checked against actual filing cadence (Apr 28 / Aug 5)	Feed date implausible; ~early November more likely, unconfirmed	NO
Stock only partially dislocated	Evidence-pack tape + news reaction	+19–21% off the low; –5% on its own print	YES
Share count, debt, cash (full capital-structure pull)	Latest 10-Q via a secondary aggregator	391.4M shares; ~\$7.2B pro-forma debt (original brief said \$6.8B — too light, a bench-caught error); \$2.459B cash, ~\$1.6B of it in stablecoins	MOSTLY — stablecoin split unconfirmed
“133 MW energized; big capacity step-up in Q3”	Satellite heat + construction-imagery detectors	Our tooling erred: both detectors ran ~200 km from the actual site, and the newest usable image predates Phase I. Zero independent physical verification	NO — coverage gap
Crypto arm “gained share” in the downturn	Could not run the seasonality tool	+34% quarter-over-quarter profit vs industry volumes –7% is suggestive but is not share math; could be one-off drawdown revenue	NO
Galaxy trades with a crypto peer cohort (the mispricing premise)	Cohort data inaccessible to both benches	Unverified — and it carries the whole bull thesis	NO
8 insider filings dated the same day as the 10-Q	SEC blocked; aggregators not yet indexed	Direction unknown; June pattern was routine exercise-and-sell	NO — flagged lead

PROPOSED ENTRY BANDS

The courts say **no entry today** — unanimously flat into the CoreWeave print. Per instructions, these are the **reopen bands**, built from the benches' own numbers:

Reopen path A — event-driven re-court (the default plan): After CoreWeave reports (Aug 11, 5PM ET) *and* the bond offering documents have been read, re-court the name regardless of price. Assigned reading: guarantee survival on lease termination, reserve-account size, Phase-I-loan cross-default. Second bench rated the name ~6/10 court-worthy conditional on exactly this work.

Reopen path B — price-driven fast-track: A retest of the 52-week low — **\$16.50 or below** (low: \$16.43) — on general market weakness rather than CoreWeave-specific bad news reopens the dislocation case immediately, since the benches agreed the current ~\$19.50–19.85 price has already absorbed a 20% bounce.

Reopen path C — thesis confirmation at any price, if any of the first bench's own stated mind-changers land: (1) offering documents show the completion guarantee is capped or expires at delivery, with a funded reserve covering 18+ months of interest; (2) a named second tenant or letter of intent on the additional 830 MW; (3) CoreWeave successfully places its \$2.6B financing or its implied default odds fall below ~20%; (4) cohort data confirming the crypto-peer-group premise; (5) site-accurate satellite confirmation that 133 MW is actually running hot.

Sizing: none proposed — sizing is the re-court's job. **No adds, exits, or trims** — we hold nothing and have no orders.

Catalyst dates: CoreWeave Q2 earnings **2026-08-11** (confirmed); Galaxy Q3 earnings **~early November 2026** (unconfirmed — the Oct 20 feed date contradicts the filing cadence); Phase I loan refinancing wall ~2028 (structural, no date).

ARMED SENSORS

(armed provisionally with this deck; session adjudication ratifies)

- price alert: fires below 16.5 (deck-provisional: retest of 52-week low (\$16.43) reopens the dislocation entry per both benches' partially-priced findin)
- filing watch: 8-K until 2027-02-06 (deck-provisional: lease amendments, guarantee changes, or financing events at Galaxy or CoreWeave transmit directly into)
- dated pack GLXY|2026-08-11: GLXY: CoreWeave Q2 earnings, 5PM ET — the dominant near-term binary; GLXY trades as CoreWeave credit risk through it (date confirmed=True)
- dated pack GLXY|2026-11-05: GLXY: Galaxy Q3 earnings (approx; Oct-20 feed date contradicts Apr-28/Aug-5 cadence) (date confirmed=False)

What remains unverified

- **The bond offering documents** — guarantee survival on lease termination, reserve size, cross-default. This is the single item both benches agree decides the case.

- **The peer-cohort premise** — the foundation of the original bull thesis; data inaccessible.
- **Physical state of the site** — no independent confirmation that 133 MW is energized or that the Q3 step-up is on track; both imagery detectors pointed at the wrong location.
- **The stablecoin share of the cash pile** (~\$1.6B claimed) — secondary source only.
- **Insider-filing direction** for the 8 filings dated the 10-Q day.
- **Galaxy's actual next earnings date.**
- **The “share gain” claim** for the crypto franchise — plausible, not demonstrated.
