

GPCR — GAP SWEEP (pre-Q3-cluster) + ADJUDICATION AMENDMENT No. 1

2026-09-04 · Closes the two NOT-RESEARCHED legs; all findings primary-sourced (registry API, EDGAR, company filings). Full agent report in the session record; this file carries the findings and the adjudicator's amendment.

The two premise corrections (kills survive on replacement ground)

1. “AZ already in Ph3 ahead of you” — **WRONG as a lead, RIGHT as a threat.** Elecglipton's Phase 3 started 2026-06-29; ACCOMPLISH started 2026-07-13 — **fourteen days apart**, readouts one-to-two months apart (2028-07-31 vs 2028-09). Dead heat, not a deficit. But the replacement finding is worse for the standalone case: **AZ registered 24,301 Phase-3 patients across nine trials** (vs GPCR's 4,700) including a 6,950-patient HFpEF outcomes trial, a 7,000-patient CKD outcomes trial, and dapagliflozin fixed-combination arms. Elecglipton arrives with cardiorenal outcome data and a combination franchise aleniglipron structurally cannot match on the same timeline. Nobody spends that on mediocre Phase 2 data.

2. “The oral market is young (\$98M first Foundayo quarter)” — **WRONG premise, STRONGER conclusion.** Novo's Wegovy pill (launched 2026-01-05): ~50k weekly scripts in week 3 → >265k weekly by July; **>5 million scripts and ~\$855M in six months** — 3.6x Lilly's launch pace. The \$98M anchor measured Lilly's execution, not the category. But the price finding hardens the kill: **Novo resets Wegovy list (injection AND tablets) to \$675/month effective 2027-01-01 (~50% cut)**, with US injectable revenue already -22% and the combined franchise roughly flat — volume expanding, price collapsing. A 2030 entrant underwrites into a \$675-and- falling reference price set by two giants.

Elecglipton Phase 2 — now disclosed (AZ H1-26 6-K, ADA June 2026)

VISTA (NCT06579092, N=310): **10.5% at 26wk vs 0.6% placebo; 11.8% at 36wk (75mg) vs 0.3%** — placebo-adjusted **-9.9 / -11.5 points**, no plateau. SOLSTICE (NCT06579105): HbA1c -1.9% vs -0.2%; carried a semaglutide comparator (AZ holds an undisclosed head-to-head). Against aleniglipron's powered -11.3: **dead level, on a cleaner (weight-losing) placebo.** Fourth independent datapoint confirming the estimand-trap conclusion: the differentiation axis is unproven. **Elecglipton tolerability/hepatic data: UNVERIFIABLE (efficacy-only disclosure)** — **now the single most valuable remaining gap.**

CT-996 royalty — weaker than framed

The filed license (10-K ex-10.23) **redacts the royalty rate** — “low single digit” is company characterization, not contract-verified. **No milestones exist anywhere in the agreement** — the running royalty is the entire forward economics. Includes a covenant not to assert future Gaserbrum patents against CT-996 (slightly reduces IP-blocking value to an acquirer). Roche behavior = soft de-prioritization: Ph2 obesity completed 2026-04-28, results undisclosed 4+ months; H1-26 investor update headlines enicepatide + petrelintide (and pairs THOSE in a combo trial) without naming CT-996 — while still funding filing-enabling pharmacology (renal-PK study started 2026-08-31). **The real gate: NCT07112872 vs-semaglutide Ph2, primary completion 2026-11-27** — pack armed.

New watch items

- **Oral zenagamtide** — Novo RENAMED amycletin (Q4-25 6-K: “zenagamtide (previously amycletin)”); any corpus grep for “amycletin” post-Feb-2026 silently returns nothing. **Oral zenagamtide Phase 3 initiation is a Q3-2026 Novo milestone — inside GPCR’s own catalyst window** as competitor headline risk.
- Foundayo self-pay schedule (\$25/\$149–349) could NOT be confirmed at Lilly primary — treat as vendor-grade until a Lilly document carries it.

ADJUDICATION AMENDMENT No. 1 (FABLE, 2026-09-04)

Verdict UNCHANGED: NO ENTRY — WATCH, human-gated. Supporting structure amended: - Kill 1 (timing) REVISED: “behind AZ” struck; replaced with “contemporaneous with a ~5x-funded competitor carrying outcomes trials + combination franchise” — SIZING/TIMING, stronger. - Kill 5 (price war) REVISED: young-market premise struck; replaced with the \$675 tablet- inclusive reset + flat franchise math — CONSENSUS, stronger. - Bull leg: M&A-scarcity floor FIRMER (AZ’s capital = external validation of the class; aleniglipron still the only unpartnered Ph3 oral); royalty leg SOFTER (redacted rate, zero milestones, Roche naming behavior). - **Prize table re-weighted: BEAR 0.40 (was 0.35) / BASE 0.42 (0.45) / BULL 0.18 (0.20); EV ≈ +5%** (from +6%) — similar EV, worse skew composition. Registered for Brier grading. - Packs: GPCR12026-09-30 amended (zenagamtide-Ph3-initiation headline risk added; elecoglipron tolerability disclosure watch). NEW GPCR12026-11-27 (CT-996 vs-sema Ph2 = royalty gate; grade Roche’s naming behavior alongside the data). - Reopen frame unchanged ($\leq \$40$ AND OLE mature discount $< 5\%$, or $\geq \$500M$ partnership — always to the principal’s gate).

KG (adjudicator-authored): asset_rename_breaks_corpus_grep (issuer renames a pipeline asset; all keyword watches silently die — fires on INN/code-name change in filings; evidence: amycletin→zenagamtide) · phase3_capital_commitment_reveals_undisclosed_phase2 (when

Ph2 results are unposted, registered Ph3 enrollment scale is the honest proxy for the sponsor's internal read — fires on Ph3 registration >3x class-median enrollment with no posted Ph2; evidence: AZ 24,301 pts incl. two mega outcomes trials).
