

PITCH — HLNE — VERDICT

ADJUDICATED 2026-09-16 — FLAT — FRE is mark-reflexive (conviction 7/10). The court found nothing to own at this price; the reopen gates below are the only path back.

What we believe

Hamilton Lane is a genuinely good business being sold at a price that is no longer obviously wrong, and the one question that matters — are the private valuations that feed part of its fee stream real, and are investors still putting money in — is not answered yet.

Three specific beliefs:

1. **Half of the fee base cannot be hurt by bad marks, and half can.** The company's own definition says fee-earning assets are a mix of capital commitments, invested capital, and net asset value depending on the contract ([FY19 10-K, sec.gov](#)). Specialized funds (~\$42.6B, +25%) are mostly fee'd on commitments/invested capital — immune. Separate accounts and the evergreen retail funds are where mark risk lives. Any argument that treats the company as all-immune or all-exposed is wrong.
2. **The headline profit growth is flattered by performance-linked fees.** Headline fee-related earnings printed +49% to ~\$124.5M, but once the fee-related *performance* revenue is stripped out, the management-fee-only version backs out to roughly \$49.9M versus ~\$53.0M a year ago — down about 6%. That is the opposite of “compounding at 25%.”
3. **The specifically accused fund was still losing money to redemptions in the very quarter the bulls call a refutation.** The short report's math targeted the non-US Global Private Assets Fund (~\$6.79B → ~\$6.55B in March, ~\$172M out). Company commentary then said redemptions were coming primarily from two of the largest non-US evergreen products. A platform-wide net inflow number (\$640M) does not clear a fund-specific accusation; it hides it.

So: the bull classification “damage absent” is unearned. The bear verdict “reject on merits” is also unearned, because the loudest bear kills turn out to be partly arithmetic errors (see the checking table). The honest label is **unresolved**, and unresolved plus a stock already +35.8% off its low equals **no position**.

What the market believes

- The August print settled it: fee-earning assets \$83.7B (+12%), fee-related earnings +49%, evergreen net inflows positive, no redemption gates enacted. Short thesis answered.
- At ~\$97.6 the stock is ~16.5x FY26 non-GAAP EPS of \$5.90, with a ~2.5% dividend yield (\$0.60/quarter, ex-date 2026-09-21, payable 2026-10-06, per [Yahoo Finance](#) / [Simply Wall St](#)) — a reasonable price for a franchise, not a distressed one.

- Mark risk is treated as a tail: everybody already knows private managers value their own holdings, so it is not news and not a differentiator.
- The stock's behaviour agrees with the market, not with us: pre-print close \$94.91, post-print ~\$99.83, now ~\$97.6. The print was *kept*, not given back.

Why we might have edge

- **The immunity split is not how the street frames it.** Almost nobody separates the commitment-fee'd half from the NAV-fee'd half before grading the short thesis. Doing so kills the bull's "12% growth proves the marks" and the bear's "every metric depends on the marks" in the same stroke.
- **The management-fee-only earnings arithmetic.** ~\$49.9M vs ~\$53.0M is a subtraction anyone can do, and we have not seen it done. It converts "+49%" into "flat-to-down."
- **The stalled leg.** Customized separate accounts — about half the fee base at ~\$41.1B — grew ~2% (+\$818M) year over year. One leg is carrying the whole franchise.
- **A public monthly dataset nobody runs.** The company publishes evergreen fund size as NAV plus net subscriptions by trade date (hamiltonlane.com/en-us/strategies/evergreen). Subtract published monthly share-class performance from the change in fund size and you get monthly net flow per fund, before the quarter is reported. Neither of our own benches ran it. That is a free, dated, pre-print read on the only mark-independent question.
- **The pack's own audited numbers contain an unused fact.** In the XBRL series both benches dismissed as "stale," fiscal Q1 revenue went \$196.7M (2024-06-30) → \$176.0M (2025-06-30), **down 10.6% year over year**, while share-based comp went \$3.2M → \$12.8M (+297%) and operating cash flow rose 61.7%. Revenue can fall while cash rises here because the mix swings on incentive fees — which is precisely the volatility the bull case calls "durable."

Why it might be priced in

- **Two-thirds of the dislocation is gone.** -36.9% from the 52-week high but +35.8% off the \$71.88 low. We are late to the fear, not early.
- **The short report is old news.** Hunterbrook published, the stock crashed and recovered. Our own blue bench graded three of the five surviving findings as *consensus*, not novel — including the circularity point and the tape point.
- **No measured disagreement with anyone.** We never extracted a single Q2 FY27 street estimate. Our "edge" on management-fee earnings is an assertion against an unmeasured consensus; it is entirely possible analysts already model the performance-fee split.
- **The bear leg that is loudest is weakest.** Interval/tender structures mean redemptions are always capped by contract ([company PR, 2026-03-24](#)) — but if those quarterly repurchase offers were *undersubscribed*, investors chose not to leave, and the bear story shrinks a lot. We have not checked.
- **Insider-capital read is neutral, not bullish or bearish.** The buyback (199k shares at ~\$100.43, ~\$20M) is 0.4% of a ~\$5.4B company. That is noise. Our own red bench sold it as a signal; it isn't one.

What could go wrong

Failure narrative 1 — we buy the gate, and the whole sector reprices anyway (monitorable).

The gates clear (two months of flat-or-positive flow, undersubscribed repurchase offers), we take a starter, and then a *different* private-markets manager takes a valuation hit — an interval fund gating somewhere else, a big write-down at a peer, a regulator commenting on retail private-fund valuation. HLNE trades with the doctrine, not with its own flows. Tripwires exist: price gates below, plus a peer basket (STEP, BX, ARES, TPG) and fund-level filings.

Failure narrative 2 — we are flat and wrong (monitorable, opportunity-cost). Management-fee earnings reaccelerate at the November print, the non-US bleed stops, specialized-fund flows stay at 25%, and the stock runs from ~\$98 back toward the old multiple while we hold a clipboard. This is the *most likely* way the pitch “fails” in the sense that matters to the book’s P&L versus the benchmark. Tripwires: monthly flow prints, the November print, price gate above \$99.83.

Failure narrative 3 — NO MONITORABLE TRIPWIRE: a private-book event. The thing that would actually break the stock in one session originates inside books that have no public series at all: a Level 3 revaluation forced by an auditor, an auditor change, an SEC exam or enforcement sweep on evergreen NAV practice, an LP lawsuit alleging stale marks, or a large wealth platform quietly pulling the evergreen product from its approved list. There is no dataset to watch. The first public signal *is* the 8-K or the price. **Unknown-unknown class named: PRIVATE-BOOK**

OPACITY EVENTS — risks whose entire information chain sits inside non-public fund accounting, fund-auditor correspondence, private distribution agreements, or a non-public regulatory file. Adjacent sub-class: **distribution-channel policy shock** (one intermediary’s approved-list decision, never announced). We cannot arm a sensor for either. We can only size for them.

The reflexive / structural leg. - *Our own size versus liquidity:* HLNE trades roughly 790k shares a day on a ~\$98 tape, about \$77M of dollar volume ([Morningstar quote page](#)). A 0.5%-of-book starter at any sleeve size this desk runs is a low-single-digit percentage of one day’s volume. **Our size is not the risk.** Exiting into a mark-panic tape is: on a gap day, volume goes up but the spread and the depth go the wrong way, and this name has already shown a ~5% overnight move on a print. - *Predicted flow:* the resolving dataset is public and monthly. Every event-driven fund reading the same page gets the same signal on the same day. Our reopen gate is therefore a *crowded* gate — expect the good news to arrive already in the price, gap-style, which mechanically converts our “buy $\leq$ \$94.91” limit into “no fill” in the good case and “instant fill” in the bad case. That asymmetry is real and we accept it rather than chase. - *Doctrine interactions:* two of our own doctrines collide here. The circularity mechanism (“you cannot refute bad marks with numbers made of marks”) pushes us to reject all NAV-denominated evidence; the mixed-basis immunity split pushes us to credit the commitment-fee’d half. Applied carelessly together they let us buy the immune half of a company the market prices off the indicted half — being right about the accounting and wrong about the stock. The second doctrine also cuts against our own bear leg: if half the fee base is structurally immune, the bear’s downside case is smaller than it sounds.

If this position loses money, the most likely reason will be ____

What we checked ourselves

claim	how checked	found	confirmed?
Current price	Pack tape (ibkr_gw)	px 97.625, dd52 –36.95%, +35.82% off low — internally consistent (97.625/154.831–1 and 97.625/71.88–1 both reproduce)	CONFIRMED as pack value
OUR OWN BENCHES ERRED — tape	Recomputed both benches' prices against the pack	Red litigated the whole case at \$95.79. Blue caught red, then mis-transcribed it itself as \$97.375. Neither number appears in the pack. Every price-derived claim in the court is off by \$1.83 (red) or \$0.25 (blue)	RED ERROR + BLUE ERROR, both CONFIRMED
Tape “gave back the entire print”	Pre-print \$94.91 vs now \$97.625	False. Stock is +2.9% above the pre-print close and ~2.2% below the post-print ~\$99.83. No round-trip. Bull thesis premise dead	REFUTED (bull error)
Share count / vote math	8-K 2026-09-10 Item 5.07	43,349,167 A + 11,836,450 B = 55,185,617 fully exchanged; 43,349,167 + 118,364,500 = 161,713,667 votes exactly ; Berkman for+withheld+broker non-votes = 133,447,702 exactly. Cap ≈ \$5.39B (8-K, sec.gov)	CONFIRMED (arithmetic closes)
Multiple / yield	px ÷ \$5.90 FY26 non-GAAP EPS; \$0.60x4 ÷ px	16.55x , yield 2.46% — blue's 2.46% was right, its 16.5x was right on its own wrong price	CONFIRMED
“FRE compounding +49%” is durable	Rebuilt from disclosed lines: mgmt/advisory \$161.4M (+21%), total fee-related revenue ~\$236M (+44%), FRE \$124.5M (+49%)	Implied performance-linked fee revenue ~\$75M vs ~\$30M; FRE ex-performance ≈ \$49.9M vs \$53.0M, –5.8% . Expense split is not disclosed, so attribution is inference, not fact	CONFIRMED arithmetic / PLAUSIBLE attribution
“\$1.7B of gross evergreen redemptions”	Checked the basis of the subtraction	Basis error. The \$2.4B gross contributions figure is scope-mixed (evergreen <i>and</i> drawdown); subtracting an evergreen-only net from a platform-wide gross produces a number that does not exist	RED BENCH ERROR — REFUTED
“Evergreen flow decelerating ~60%”	Compared \$640M one-quarter net flow to +\$6.7B LTM AUM change	Stock-vs-flow error. The LTM figure contains appreciation and new fund launches. \$640M on ~\$19B	RED BENCH ERROR — REDUCED to non-finding

claim	how checked	found	confirmed?
		is ~3.4% of assets in a quarter	
“Buyback above today’s price = management says it’s not cheap”	Sized it: 199k × \$100.43 ≈ \$20M vs ~\$5.39B cap	0.4% of the company. Not a capital-allocation verdict at a firm whose stated policy is a rising dividend	RED BENCH ERROR — OVERTURNED
“Every refuting metric is a function of the marks”	Issuer’s own FEAUM definition (10-K, sec.gov)	False for ~half the base. Specialized funds \$42.6B (+25%) are largely commitment/invested-capital fee’d	RED BENCH ERROR — REFUTED as stated; downgraded to MATERIAL
FEAUM growth is broad	Split the legs	Single-legged. Separate accounts ~\$41.1B grew ~2%; specialized funds grew 25%. Blended fee rate ~69bps is rising on <i>mix</i> , not price — it reverses if specialized flows slow	CONFIRMED (bear-side; both benches initially missed it)
Pack XBRL “too stale to use”	Used it anyway	FQ1 revenue –10.6% YoY (\$196.7M→\$176.0M); SBC +297% (\$3.2M→\$12.8M); OCF +61.7% ; SBC rose from 4.0% to 9.9% of operating cash flow	CONFIRMED — both benches discarded usable audited data
“No gates were enacted”	Fund structure docs (PR 2026-03-24)	Interval/tender structure: repurchase offers of at least 5% of shares quarterly; no shareholder right to demand redemption. “We didn’t gate” means “demand stayed under a cap we wrote.” But red called this “empty” without checking whether offers were undersubscribed — which is the informative number	CONFIRMED structure / RED OVERREACHED ; downgraded to DATA
Monthly flow dataset availability	Fetches the evergreen page	Page carries fund size as NAV at June 30, 2026 plus subscriptions for the July 1, 2026 trade date. So at pack build there was at most one to two usable months, not three as claimed	BULL + RED BOTH OVERSTATED ; blue correct
The decisive test was run	Read both benches’ work	It was never run by anyone. Zero connectors fired on the resolving dataset	CONFIRMED — fatal to any entry today
Earnings date 2026-11-03	Filing inventory + company PR cadence	Unconfirmed. yfinance-derived; no company PR names it. Cadence is a ~4-week-ahead announcement PR	NOT CONFIRMED

claim	how checked	found	confirmed?
Detector coverage	Compared both benches' lists	Red omitted three atlas entries entirely (common-control merger accounting, JOBS Act exemption audit, customer-ID) — validator defect. Red also tagged app_review_velocity as "FIRED" when it described an <i>absence</i>	RED PROCESS ERROR , blue's correction accepted
Secondary quote cross-check	Morningstar quote page	Shows ~\$101.21 on 2026-09-08 and a 52-week range of \$71.88–155.66 vs the pack's 154.831 high; also shows a \$4.39B cap because it counts Class A only	DIVERGENT — unresolved, see unverified #1

PROPOSED ENTRY BANDS

The courts say no-entry. Nothing is bought today. These are reopen bands.

Reopen Gate A — data (both conditions, not either): 1. For the Global Private Assets Fund **and** the second large non-US evergreen vehicle: net flow ≥ 0 in **two consecutive months**, computed as (fund size at month end – fund size at month start) – published month-to-date share-class performance. Use the trade-date-stamped figures from hamiltonlane.com/en-us/strategies/evergreen. Target months: Aug 1 and Sep 1 trade dates, Oct 1 when posted. 2. The most recent quarterly repurchase offer was **undersubscribed** (requests below the ~5% cap, no proration), per fund filings.

If Gate A clears: - STARTER: 0.5% of book, limit $\leq$ **\$94.91** — the market's own pre-news close. We do not pay more than the price that existed before the print we don't fully trust. - **Add 1: +0.5% at $\leq$ \$88.50** (15x \$5.90) — only if Gate A is still true at the time. - **Add 2: +0.5% at $\leq$ \$82.60** (14x) — requires Gate A plus one clean quarter of management-fee-only FRE growth ≥ 0 . - **Hard cap: 1.5% of book**. This is an unresolved mark-integrity name; it never becomes a core position on this evidence.

Deep-value reopen without Gate A (fear-driven, evidence-light): **\$76.70 (13x)** for a 0.25% probe and **\$70.80 (12x)** for a second 0.25%, and *only* with a Q2 FY27 Level 3 roll-forward showing realized exits at or above carrying marks. Below \$71.88 (the 52-week low) we do not buy at all — a new low means the private-book narrative is winning and we don't own the information.

Stand-down band: above **\$99.83** (post-print high) the recovery is complete, the discount we were paid for the uncertainty is gone, and we do not initiate at any gate.

Kill rule (no re-court): any single month of *accelerating* outflow in either named non-US fund, or a prorated (oversubscribed) repurchase offer. Dead, file closed.

Trims/exits if a starter is ever taken: exit in full on a \$71.88 break; trim half at **\$125** ($\approx 19\times \sim \6.60 forward) or if performance-linked fees exceed $\sim 35\%$ of fee-related revenue for two consecutive quarters — that is the mix getting *more* mark-dependent, not less.

Catalyst dates: 2026-09-21 ex-dividend (secondary-sourced) · 2026-10-06 dividend payable **and** the expected earnings-date announcement PR · $\sim 2026-10-01$ to 10-10 evergreen page refresh with Oct 1 trade-date data · quarter-end repurchase offer results · **2026-11-03 earnings, UNCONFIRMED** (~ 37 sessions out; no print-proximity constraint applies today) · Q2 FY27 10-Q $\sim$ mid-November, which carries the Level 3 roll-forward.

ARMED SENSORS

- NONE ARMED — the deck must flag this as a gap

This is the single biggest operational failure in this court: the entire recommendation hangs on a public monthly dataset and nothing is watching it. Sensors the courts imply are MISSING and must be armed before any gate can be said to have cleared:

- **MISSING — monthly evergreen fund-size scraper** (evergreen page, trade-date stamped) plus share-class MTD performance, differenced per fund. This is Gate A leg 1. Without it the pitch is unresolvable by construction.
- **MISSING — repurchase-offer / proration watcher** on the interval fund and tender-offer vehicles (fund-level EDGAR CIKs: N-23c-3, N-CSR, prospectus supplements). Gate A leg 2.
- **MISSING — FRE-ex-performance-fee decomposition**, re-run automatically on every earnings exhibit. Our whole differentiated claim is this subtraction.
- **MISSING — separate-accounts FEAUM growth tracker** (the $+2\%$ stalled leg) and blended-fee-rate mix decomposition.
- **MISSING — Level 3 roll-forward diff** on each 10-Q: realized exit proceeds versus prior carrying value.
- **MISSING — live quote rail.** No live price in this container; the pack tape and a secondary quote three days earlier disagree by $\sim \$3.6$. Every band above is priced off an unverified tape.
- **MISSING — options chain feed** (strike-level midpoint IV, IV percentile, realized vol). See prize table: without it we cannot express anything in options.
- **MISSING — event gates on Form 8-K** (earnings-date PR, Item 4.01 auditor change), **10-Q, Form 4** (insider selling into strength — six Form 4s on 2026-06-02 and three on 2026-06-15 are unexamined), and fund-level filings.
- **MISSING — peer/doctrine basket** (STEP, BX, ARES, TPG) to separate a HLNE-specific flow break from a sector-wide repricing of private marks.
- **MISSING — hiring-velocity baseline** at Conshohocken/Scranton. Contested between benches; it cannot separate margin pressure from distribution build-out, so we treat it as colour only, but with no recorded baseline it is not even that today.

What remains unverified

1. **The actual current price.** Pack says \$97.625 (2026-09-11); a secondary quote shows ~\$101.21 on 2026-09-08. No live rail available. Every band here shifts if the tape is wrong. *Estimate: \$95–\$105, p 0.8 the true print is in that range.*
2. **Monthly net flow for the Global Private Assets Fund and the second large non-US evergreen vehicle, Aug and Sep 2026.** The resolving datum. Never run by anyone. *Estimate if forced today: –\$100M to –\$250M per quarter continuation, based on the ~\$172M March print and disclosed “elevated redemptions,” p 0.55 that flow is still negative.*
3. **Whether the latest quarterly repurchase offers were undersubscribed or prorated.** Decides whether “no gates” is meaningful or empty. *Estimate: undersubscribed in US vehicles, at-or-near cap in non-US, p 0.5.*
4. **The exact fee-related expense split and the disclosed performance-linked fee revenue line.** Our –5.8% management-fee-only figure is an inference from three disclosed totals. *Estimate: performance-linked fee revenue \$70–80M in the quarter, p 0.7.*
5. **Street consensus for Q2 FY27** (management-fee revenue and FRE). Zero estimates extracted by either bench, so our “edge” is unmeasured against the number that matters.
6. **Options chain: strike-level midpoint implied vol, IV percentile, realized vol.** No chain retrieved. *Estimate: 30-day IV 30–40%, from the base rate for mid-cap asset managers carrying an open short-report overhang, p 0.6.*
7. **Q1 FY27 Level 3 fair-value roll-forward — realized exits versus carrying marks.** The cleanest possible test of the short thesis, and it sits in a filing we have not parsed.
8. **Redemption queue composition and LP concentration in the non-US evergreen funds.** Structurally private; no public series exists. This is the private-book-opacity exposure named in the pre-mortem. *Estimate: top-10 distribution partners ≈ 50–70% of non-US evergreen assets, from sibling public interval-fund structures, p 0.5.*
9. **Whether 2026-11-03 is the real earnings date.** yfinance-derived, no company PR. *Estimate: 2026-11-03 ±7 days, p 0.7, resolving when the ~4-week-ahead PR posts around 2026-10-06.*
10. **Our own book size and what “0.5 sleeve” means in dollars.** Blue’s sizing instruction is ambiguous; we read it as 0.5% of book. Internal, resolvable in one conversation, but unresolved as written.

PRIZE TABLE + VOL READ

Anchor: today’s \$97.625 and 16.55× FY26 non-GAAP EPS of \$5.90. Adjust from there for (a) management-fee-only earnings flat-to-down, (b) ~half the fee base immune to marks, (c) ~36% of the dislocation still unharvested. Horizon ~12 months.

scenario	what happens	prob	price
A — clean rerate	Non-US flows turn positive, management-fee FRE reaccelerates >15%, marks tested by real exits at/above carry; ~19× ~\$6.60	0.20	\$125

scenario	what happens	prob	price
B — muddle	Flows roughly flat, management-fee FRE flat, performance fees carry the print; ~16x ~\$6.20	0.35	\$99
C — bleed persists	Non-US outflows continue and spread, performance fees normalize down, mix-driven fee rate reverses; ~12x ~\$5.60	0.30	\$67
D — private-book event	Forced remark, auditor/regulatory action, or a distributor pulls the product; ~9x ~\$5.00	0.15	\$45

EV = 0.20(125) + 0.35(99) + 0.30(67) + 0.15(45) = \$86.50, i.e. -11.4% versus the \$97.625 tape.

Our own table says the stock is *expensive*, not cheap. That is the arithmetic reason the verdict is no-entry rather than “small starter now.”

Table dispersion: $\sigma_{\text{table}} = \$26.90 = 31.1\%$ of EV, 27.6% of spot over ~12 months.

Expression math (shown, with its blocking gap stated): - 1-year \$100 call off our own table:

$C_{\text{ours}} = \sum p_i \cdot \max(S_i - 100, 0) = 0.20 \times \$25 = \mathbf{\$5.00}$ (5.1% of spot, undiscounted). - 1-year \$110 call:

$0.20 \times \$15 = \mathbf{\$3.00}$. 1-year \$90 call: **\$10.15**. - 1-year \$85 put (the cash-secured-put candidate):

$0.30 \times \$18 + 0.15 \times \$40 = \mathbf{\$11.40}$ — about 11.7% of spot. Selling that put for anything a real chain

would pay is negative edge by our own numbers, because our table puts 45% of the probability mass below \$85. - **VRP (IV – RV): CANNOT BE COMPUTED. No chain and no realized-vol series were retrieved.**

Per the TSSI lesson (71 vs 101), we will not substitute an aggregate underlying IV feed for chain-level midpoint IV on candidate strikes — those two numbers diverge enough to flip the recommendation. Until we have real bid/ask midpoints at \$85/\$100/\$110, the comparison of σ_{table} 27.6% against “IV $\times \sqrt{T}$ ” is unavailable, not estimated. - **Bimodality:** the table is fork-dated on the monthly flow prints. Mass concentrates in B (\$99) and C (\$67) with a thin bridge between them — a single vol number understates the jump. Expect the resolution to arrive as a gap on the day the monthly page updates or the November print lands, not as a drift.

Instrument recommendation — the output of the above arithmetic: NONE. Not stock (EV

$\$86.50 < \97.63). Not calls (we cannot price the chain against our \$5.00/\$3.00 fair values, and

buying convexity into a negative-EV table is paying twice for the same uncertainty). Not cash-

secured puts (our own \$11.40 fair value on the \$85 strike will exceed any real premium, so we

would be selling insurance below cost on the exact risk we say is unresolved). Not covered calls

(no underlying). **When Gate A clears, the default expression is common stock at the limits**

above — plain, because the flow gate removes uncertainty rather than creating the kind we would want to own optionality on, and because we have no chain to prove otherwise.

TAX overlay: any options structure with a horizon matching this table expires after 2026-12-31, so the loss branch (scenarios C and D, 45% of the mass) would land in the 2027 tax year and defer the deduction. In a harvest year that disqualifies the trade unless the edge numerically dominates the deferral. Here the edge is *negative* (-11.4%), so it cannot dominate anything: options are

excluded on tax grounds as well as on merit. If a gated entry is later taken in stock, it should be opened after any 2026 harvesting is complete to avoid wash-sale entanglement with the peer basket.

ADJUDICATION — 2026-09-16 15:36Z

Management-fee-only FRE ex fee-related performance revenue $\approx$ \$49.9M vs \$53.0M, down ~6% YoY (NOVEL, sustained). DAMAGE-ABSENT not supportable on the indicted non-US vehicles.

REOPEN GATES: AUM-minus-MTD-performance subtraction on the Global Private Assets Fund + second large non-US vehicle for Jul/Aug/Sep, plus repurchase-offer proration: two consecutive clean months → re-court
