

Houmanoids — Follow-up Questions

2026-09-02 · v3, consolidated from the full claims parse (98 claims, 70 documents) · Sent with appreciation for an unusually transparent data room — the candor in it is a big part of why we're engaging seriously. These questions are where our diligence wants documents to lean on; none are gotchas, and "we don't have that yet" is a perfectly good answer where true.

A. Corporate & capital

1. Could you share the Syndi Co and Hou Ventures note instruments (rate, maturity, security) and a pro-forma cap table showing the Syndi conversion at the \$10M cap alongside the seed SAFE? We'd also love to understand the relationship between that cap and the \$54M pre on the round — and whether founders/insiders participate in the new round on the same instrument as outside money.
2. The instrument described is an uncapped SAFE with MFN or a 15% discount — which have actual signers taken so far, and how does the uncapped MFN interact with the stated pre-money?
3. We noticed the executed OCTOPUS and Syndi RSPAs carry blank share-count fields (and OCTOPUS a blank vesting date), and the OCTOPUS 40,000 shares appear in the Jul 31 ledger but not Dec 31 — probably just paperwork cleanup, but could you walk us through it?
4. What's the plan and timing for the Form D filing?
5. A few small balance-sheet items we'd like color on: the "Due from Shareholder \$11,141.79" receivable and its terms, and the ~\$77K "research unit" sale in August (buyer and what was sold).
6. Were there any instruments or informal commitments from the July 2025 Denver early-investor session that aren't on the cap table?
7. Current monthly burn, expected burn at ~20 deployed units, runway without the raise, and the use-of-proceeds waterfall for the \$3M?

B. Related parties

8. Which pilots and LOIs are fully arm's-length? For Amoriss specifically: what rate is actually being paid from September 1, under which document (the signed LOI contemplates \$100–\$1,000/month and the definitive agreement is unexecuted), and who approved terms on the Houmanoids side? We understand why an affiliated first deployment makes sense operationally — we just want the related-party picture cleanly mapped.
9. Matt Ritchie sits in a few seats at once (advisor-shareholder, reference, Fern-View asset owner) — what does the Aug 1 Advisor Agreement oblige, and how was the overlap disclosed

in each direction?

10. Taylor — how are you allocating time across APM Help/Syndi, Amoriss, Fyxed, and Houmanoids, and are there relationships among the entities beyond the disclosed loans and the Amoriss contract?

C. Compliance & supply chain

11. Could you share the component-level BOM for the current K9 fleet, with country of origin and FCC IDs for the radio/camera modules? We'd like to map it against the §889/1260H/covered lists ourselves so we understand the baseline you're working from.
12. On the path from "screened" to "affidavit-grade" certification — who performs the BOM audit, what's the completion date, and how do the signed LOIs (especially the RPSO affidavit precondition and the January timeline) sequence if supplier attestations for the HLC cameras, lidar, and battery cells take longer than hoped?
13. What's the current thinking on the Hesai lidar given its §1260H listing — replacement candidates, cost delta, qualification timeline?
14. For the Dimensional exemption and FCC DA-26-786: could you point us to the underlying instruments/dockets, and to the exemption's exact scope as applied to Deep Robotics-based fleets? Also, the fleet's FCC authorization inventory (grant numbers, grantees, dates) and which planned hardware changes would trigger new authorizations.
15. The Deep Robotics relationship: executed terms on warranty (the model assumes parts-free year 1 plus a negotiated 3-year extension), CKD kit supply with telecom removed, pricing/volume/ exclusivity/IP — and how you'd navigate it if Deep Robotics itself were added to a restricted list.
16. How do you think about which customer channels carry federal funding exposure (police grants, E-Rate), and where 2 CFR 200.216 does and doesn't bind?

D. The US assembly plan

17. Where do the England Airpark/FTZ arrangement and the AgiBot relationship stand on paper today, and what does the path to executed agreements look like? How does plant financing sequence relative to the seed?
18. Help us understand the origin analysis once assembly moves onshore: which components would still be Chinese-origin, and how does that interact with the covered-equipment rules?

E. Regulatory positioning

19. In conversation, the fire-watch opportunity came up in a Louisiana context; the data room's research (which we thought was genuinely good) frames it as a Houston path with approval still to be earned, and Act 288 as a procurement statute. Could you walk us through the current fire-watch strategy — which jurisdiction and code instrument you'd pursue first, and any AHJ conversations to date? Going forward, documents alongside the verbal story help us move faster.

20. More generally: a short list of every regulatory approval or exemption the pitch relies on, each with its current documentary status, would be enormously helpful.

F. Rapides economics

21. Help us reconcile the RPSO LOI's signed terms — no-cost pilot, \$1,000/K9/month list applied to sponsor shortfall only ("0 parish outlay"), an RFP procurement step, and the post-pilot donation of ~60 K9s to a 501(c)(3) — with the forecast's public-site revenue ramp and the KPI page's \$120k MRR / \$1.44M year-1 for this account. Where does the donated hardware (~\$2.4M at the \$40k basis) live in the model?
22. What establishes the "January 5 deadline"? The LOI specifies Spring & Fall 2027 semesters and the PSA draft says 2026–27, so we want to make sure we're anchored on the right date.
23. Which sponsors have signed, at what monthly amounts, and has Cleco responded to the anchor proposal? (The dealer tiers are \$100–\$1,000/K9/month; the Plan case needs \$3,000/site at full fill.)
24. One small count question: we see 54, ~60, 66, and 55 Rapides campuses across documents, and the LOI's "two per campus, all schools" implies ≥ 108 units against the plan's 54 — what's the canonical number and unit assumption?

G. Product, privacy & insurance

25. Does any K9 or Houdini component record today — under any mode, buffer, or vendor firmware path? We'd like to reconcile the no-recording posture (on which the FERPA position rests) with the RPSO LOI's "streaming and recording" capability line, the AirGarage auto-record clause, and the School Board's 30-day-retention requirement — and see the June 28 engineering privacy review.
26. What did the actuator-failure post-mortem conclude, and what's the fleet reliability picture (MTBF, warranty/service history) so far?
27. What insurance will be bound to meet the AirGarage draft (\$4M umbrella, \$2M cyber/E&O) and the RPSO draft (\$3M/\$5M CGL + step-up), and at what premium delta to the current program?

H. Pipeline & traction

28. For each pending LOI (RPM, Lincoln Parish, AirGarage, Rockwell): status today vs the Aug 19 snapshot, and any that have since gone quiet. And could you enumerate the blurb's "8 LOIs / 80 sites" against the founder-confirmed ledger of 3 signed · 4 pending?
29. What conversion assumption do you use from the \$197M indicative pipeline to contracted revenue, and what's the modeled-vs-quoted rate per account (the RPSO row appears carried at \$1,000/K9 while other rows model \$3–6K)? Are there two pipeline counterparties we could speak with?
30. On Eglinton: who is "Zanir" relative to Eglinton Property Management's registered officers, and what moved the Michigan property outside the deployment area given the density thesis?

I. Unit economics & operations

31. The density model's ~31% service-cost ratio is the heart of the economics — could you share the per-unit service-cost buildup from actual pilot experience so far? We ask because the public comparable (Knightscope) has run \$1.38–1.71 of service cost per revenue dollar for five straight years, and we'd like to understand concretely what your model does differently.
32. The teleop model prices six operators (two shifts Brazil, one Manila) at \$2,000/month all-in; today two Brazil contractors exist. What's the Manila plan, and which entity employs the operators?
33. Two bookkeeping items: when do deployed robots move out of "Robots Not Yet in Service" (all \$175K sits there despite five months of field history), and which depreciation life applies — the forecast's 3 years or the FAQ's 2?
34. FAQ Q7 says one monthly price covers connectivity; the Eglinton LOI bills cellular data separately — which is the go-forward standard?

J. China operations & data

35. What role does the Shanghai WFOE play going forward, and what's behind the \$50M subscribed / \$0 paid-in structure? Relatedly: repayment terms and timeline for the \$225,000 advance to Hou Jiyuan (Shanghai) and the \$34,091 equipment advance, the "commercial arrangement being finalized" with the domestic chain, and who funds the Shanghai office and 16-person team.
36. For school and law-enforcement deployments: where is video processed and stored, and does any data path touch PRC entities or personnel? Any FERPA/state-law analysis you've done would be great to see.
37. Do the IP assignments cover work by China-based engineers? A quick view of the chain would close this out.

We know the data room logs reads, so you've seen the depth of our pass — take that as the compliment it is. Documents beat calls for most of these; happy to walk through any of them live after we've read.
