

PITCH — HUBS — VERDICT

ADJUDICATED 2026-09-10 — HOLD — NO ADD (conviction 7/10). The regime/drawdown thesis was **REJECTED** as actionable for this name; see the **EVENT ADDENDUM** at the end for the ruling. Any earlier 'ADJUDICATED' line in this deck referred to a prior court and is superseded.

What we believe

HubSpot is a real business that got expensive on the wrong line. It is GAAP-profitable, carries no long-term debt, grows mid-teens in constant currency, and sits 57% below its 52-week high at \$224.51 (32% above the \$169.65 low). That combination is why we owned it and why we still own half of it.

But the thing we were being paid for — accelerating customer growth after the April price cuts — has not shown up, and the company's own August 5 guide says it probably won't this year: 5,000–6,000 net adds, net revenue retention flat at ~102%, roughly 3 points of the reported growth coming from a weak dollar rather than from selling more software. Strip the currency help and the exit rate is about 11% constant-currency. You are paying roughly **57x GAAP operating income** (\$9.86B enterprise value against a ~\$173M annualized GAAP EBIT run-rate) for an 11% grower whose pricing model was deliberately made cheaper per customer with the payback still unproven.

Two things keep us from going to zero. First, deferred obligations longer than one year grew about 31% year over year against 15% constant-currency revenue — customers are signing longer, which is not what churn looks like. Second, the balance sheet is unlevered and the share count is *shrinking* (52.7M → 49.3M diluted), so the buyback has more than covered dilution.

Net: this is a **size problem, not a solvency problem**. Business risk cuts size; it does not force an exit. Half on, cap re-derived from 1.2% of book to 0.5%.

What the market believes

The market believes almost exactly what we believe, and that is the uncomfortable part. The sell side models ~13% annual revenue growth for three years. The company guided Q3 to \$924–925M against a \$941.2M consensus — it guided **below** the street, and the street did not revolt. Roughly 10% of the shares outstanding are sold short (about 5.0M shares, ~4 days of average volume), so the bear case is not an orphan idea; it is a crowded one.

So the market believes: decent company, decelerating, no longer a premium-multiple story, and enough people are short that any clean beat hurts. The gap between us and consensus is not about the forecast. If we have anything, it is about the **multiple**, not the numbers.

Why we might have edge

1. **The long-dated backlog signal.** >1-year remaining obligations up ~31% while constant-currency revenue grows 15%. Consensus is extrapolating the reported revenue line; the contract line says customers are committing further out. This is the single piece of information that is not in the 13% model.
2. **We can build a billings read before the print, and one of our own benches proved it.** HubSpot does not report RPO or cRPO, and our red bench declared the check impossible. That was wrong. The deferred-revenue note discloses quarterly invoicing directly (Q1-25: \$766.8M invoiced against \$714.1M recognized), so a billings series is derivable from the primary filings. That gives us a pre-11/04 read most screens will not have.
3. **Positioning asymmetry.** 10% short + a \$1.0B buyback authorization + shrinking share count means a merely-okay Q3 can move this violently upward. Crowding is a reason to size down, never a reason to reject.
4. **Cost discipline that the bear case understates.** Stock comp is growing ~5% a year while revenue grows mid-teens — SBC/revenue is ~13.3% and falling from ~17%.

Honest scoring: item 2 is process edge (we can see something a day or a week early). Item 1 is the only real analytical edge, and it is mix-confounded by the April multi-year contract push — which is exactly why it bought half a position and not a full one.

Why it might be priced in

Most of it is. At \$224.51 you are already paying only ~2.68x EV/sales, versus a bear case at \$170 that is itself 2.0x sales. The de-rate has happened. The street already models the deceleration. The short book already exists. And the pieces of the bull case that felt strongest turned out to be arithmetic errors on our side:

- The “6.4% free cash flow yield” was a pre-stock-comp number. Net of ~\$490M of annual SBC, owner free cash flow is roughly **\$167M, about 1.7% of enterprise value.**
- The “\$1.34B of net cash as a cushion” and “the \$1.0B buyback as an unspent catalyst” are the same dollars. You can credit one or the other, not both.
- The “implied vol below realized vol means the option market hasn’t repriced this” claim was backwards. Realized vol contains the –20.2% earnings gap. Implied falling below post-event realized is the ordinary post-catalyst vol crush, not a dislocation.

What is *not* obviously priced: the multi-year backlog mix, and the possibility that a 5,500-add quarter with 103% NRR reads as an inflection rather than a miss.

What could go wrong

Failure 1 — The slow one: AI erodes seat-based CRM and NRR never gets back above 103%. Agentic tools reduce the number of human seats a customer needs; HubSpot’s per-seat model bleeds a point of NRR a year, adds stay in the 5–6k band, and 57x GAAP EBIT compresses

toward 2.0x sales (\$170) with no single bad quarter to point at. *Tripwire*: NRR and net adds each quarter; billings growth derived from the invoicing line. Monitorable. This is also the factor we already own twice via MNDY — courting them together is one bet, not two.

Failure 2 — The fast one, and it hurts because we trimmed: the squeeze. 5.0M shares short (~4 days of volume) plus a buyback retiring ~2.4M shares a quarter meets an in-line-to-good Q3. The stock goes 224 → 300+ in a week and we own half of what we owned. Losing money you already had is still losing money. *Tripwire exists but we never armed it* — we have a downside price alert at 169.63 and no upside alert at all. Fixed below.

Failure 3 — No monitorable tripwire: our own book state is not trustworthy. The court adjudicated a “trim-50 on 83 shares.” The book holds **42 shares**. The armed instruction (149) says **SELL 51** — more than we own. Somewhere between the brief, the instruction generator and the custodian record, the position was described three different ways, and *no market data feed fires when our internal state is wrong*. There is no price, no filing and no 8-K that alerts us to this. Unknown-unknown class: **internal-state / reconciliation drift (data-integrity failure in our own plumbing, not in the issuer)** — the sibling class of the “which lot did we actually sell” and “which tape did the bench use” errors that both benches committed in this very case. The only defence is a scheduled reconciliation, which is a process, not a sensor.

The reflexive and structural leg. Our own size is irrelevant to the tape: 21 shares against roughly 1.2M shares of average daily volume is **0.0018% of a day** — we have zero market impact and we should not pretend our exit is a risk factor. The reflexivity that matters is other people’s. The company itself is the largest predictable buyer: \$531.9M of Q2 repurchase is ~2.4M shares, about two full days of volume every quarter, and it is price-insensitive. Against that sits the 5.0M-share short book, ~4 days to cover. That is a market where the marginal buyer is mechanical and the marginal seller is levered to a single data point on 11/04 — thin two-sided liquidity into an event, fat tails both ways. Doctrine interactions we are consciously accepting: (a) **CROWDED sizes, never rejects** — so 10% short cut us to half instead of to zero; (b) **business-risk → size cut, not exit** — same direction; (c) the **no-double-credit rule** (cash or buyback support) which killed the valuation leg; and (d) the honest tension between (a) and (b): both doctrines push toward “hold something,” which means the doctrine set has a structural bias against ever going flat. We should name that rather than pretend the half-position was independently derived twice.

If this position loses money, the most likely reason will be that the April price cuts bought customers who never upgrade — Q3 lands 5,000–6,000 adds with NRR stuck at 102%, the constant-currency exit rate confirms ~11%, and a 57x-GAAP-EBIT multiple grinds toward the \$170 / 2.0x-sales trough while we are still holding the other half.

What we checked ourselves

claim	how checked	found	confirmed?
Book holds 83 shares; “trim-50” = 51 shares	Evidence pack BOOK block	42.0 sh @ 186.7875 , orders NONE. Trim-50 = 21 shares , not 51. Instruction 149 is arithmetically unexecutable	NO — our own instruction is wrong

claim	how checked	found	confirmed?
Position value / P&L	42 × 224.515 vs 42 × 186.7875	\$9,429.63 value, \$7,845.07 basis, +\$1,584.55 (+20.2%) unrealized gain	YES
Red bench tape (228.025)	Cross-check vs pack	Not in the pack; inconsistent with pct_off_low. Every red multiple ~1.5% hot	NO — red bench error
Blue bench tape (225.01)	Cross-check vs pack	Also not in the pack (pack: 224.515). Both benches used off-pack tape while charging the thesis with exactly that sin	NO — blue bench error too
Market cap / EV	49.87M sh × 224.515, less \$1.34B net cash	\$11.20B cap, \$9.86B EV, 2.68x EV/S — red said 11.37/10.03, blue said 11.22/9.88, thesis said 11.64. All three wrong, ours smallest	corrected
“6.4% FCF yield”	\$667M non-GAAP FCF less SBC run-rate	SBC growing ~5%/yr → FY26 ≈ \$490M ; owner-FCF ≈ \$167M = 1.7% of EV . Red said 1.1% (used \$560M SBC) — overstated the damage by ~55%	REFUTED as 6.4%; red’s magnitude also wrong
“Net cash is a cushion” + “buyback is an unspent catalyst”	Q2-26 8-K balance sheet	Cash+investments \$1.8B → \$1.4B. Cannot credit both — the buyback spends the cash	CONFIRMED (thesis leg dead)
“Balance sheet exhausted in <4 quarters”	Two-quarter draw rate	\$200M/qtr → ~7 quarters , and diluted shares fell 52.7M → 49.3M, so the spend over-covered dilution	NO — red bench error, overturned
Red charged SBC <i>and</i> the buyback as separate drains	Internal audit	Same economic cost counted twice — the mirror image of the sin red was prosecuting	red bench error
“IV 63.6 vs RV 105.8 = unpriced flow”	Vol basis + event calendar	The –20.2% day <i>is</i> the 8/5 print inside the RV window; IV<RV after an event is mechanical	REFUTED (thesis leg dead) ; red tagged it NOVEL while calling it textbook — tag error, it is CONSENSUS
“Cheap at 14.1x forward and GAAP-profitable”	Q2 PR vs statistics page	GAAP op income \$43.3M real, but 14.1x is <i>non-GAAP EPS</i> ; trailing GAAP P/E 75.7x, ~57x EV/GAAP-EBIT on run-rate	CONFIRMED — two companies in one sentence
“We agree with the street ⇒ no edge”	Consensus extraction	Guide \$924–925M vs \$941.2M consensus, 13% 3-yr model — all true. But nobody produced the street’s price target , which is the anchor a prize-table thesis diverges from	partially refuted — red bench overreach
rpo_drift “UNCHECKABLE”	Blue re-ran via the deferred-revenue note	Invoicing <i>is</i> disclosed (Q1-25: \$766.8M invoiced vs \$714.1M recognized) →	REFUTED — planner and red both wrong; blue won the contest

claim	how checked	found	confirmed?
		billings series derivable. Planner had also ruled it uncheckable	
Detector dispatch hygiene	Compare graded list to this pack's dispatch	Red graded austin_permits, beauty_velocity_poll, beauty_virality — not in this dispatch — and skipped three clinical entries that were. Copy-forward from another case	red bench error
Red's verdict enum	Read red's own text	Header says REJECT , position line says HOLD-NO-ADD the 42 shares . A reject that holds is a no-add	red bench internal contradiction
"Prize table mandate N/A" (blue)	Deck PRD	Wrong: time-gated private items exist (net adds, NRR, buyback pace) → the table is required . Built below	blue bench error
Insider selling = benign vest-and-sell	Pack filing inventory	Five Form 4s 9/2, plus Form 144 on 8/18 and 8/4 and a Form 3 on 8/6. Benign read is plausible but asserted, not shown — 10b5-1 dates unread	not confirmed; no verdict rests here
Deferred revenue inflates "net cash"	Blue N3	~\$767M/qtr invoicing implies a large deferred balance; correct treatment is a ~15% cost-to-fulfill haircut (~\$150M EV), not a \$1B deduction . 6/30/26 balance unread	directionally confirmed, magnitude open (item 2)
Options: use IV 63.6 for strike math	Doctrine check (TSSI 71 vs 101)	63.6 is an underlying aggregate feed , not chain midpoints. Neither bench pulled a chain. All option conclusions below are provisional on that	NO — both benches

PROPOSED ENTRY BANDS

There is no entry. The adjudication ratified a trim. These are the execute-now, reopen and kill bands, taken from the courts' own math.

A. Execute now (the ratified action) - SELL 21 shares (half of 42) at market or better, working limit **≥ \$220** — not the 51 shares in instruction 149, which exceeds the position. Proceeds ~\$4,715; realized gain ~\$792 at the blended basis. **Check tax lots first and sell highest-cost lots (HIFO).**

- Post-trim holding: **21 shares ≈ \$4.7k ≈ 0.5% of book** — which is exactly the re-derived cap (1.2% → 0.5%). The trim and the cap agree; that is the check that this size is derived, not chosen.
- No stop on the remaining half. Business risk was expressed through size, not through a price stop.

B. Reopen / RE-ADD the other half (price-gated *and* data-gated — both must clear) - Data gate (verbatim, documented): Q3 10-Q RPO growth >20% AND net adds ≥6,000, *or* NRR ≥103%. - **Price gate:** re-add up to 21 shares at ≤ \$265 (our own base case — we do not chase past our EV). If the data clears and the stock is already >\$265, the re-add is **void**; the move happened without us. - Size on re-add: back to ~1.0% of book, not the old 1.2%.

C. Kill the remaining half - Q3 net adds <5,000 OR NRR <102% → sell the remaining 21 shares (the guide was the ceiling, not the floor). - **Derived billings growth <12%** (invoicing line vs revenue in the Q3 10-Q) → trim to zero. (*Blue gate i.*) - **Q3 repurchase >\$300M with cash+investments <\$1.2B** → cut the remainder in half again. (*Blue gate iii.*)

D. Trim into strength - ≥ \$265 (EV reached, +18% from here): sell the remainder, unless the Q3 data gate in B has already cleared, in which case hold to \$300.

E. Below the low - < \$169.63: do **not** buy the dip automatically. That level breaking before Q3 means the market resolved the growth question without us. Re-court immediately; reopen only with a billings read ≥12% already in hand.

Catalyst dates: 2026-11-04 Q3 print (**date UNCONFIRMED — vendor-derived, no company PR names it; confirming PR is itself a gate**) · 2026-11-05 Q3 10-Q and the frozen re-court call (0.45) · 2027-02-13 end of the 10-Q/10-K filing watch · 2026-08-12 armed trim execution (needs the 51-vs-42 reconciliation before it can fire).

ARMED SENSORS

(armed provisionally with this deck; session adjudication ratifies)

- price alert: fires below 220.0 (deck-provisional: working-limit floor for the ratified 21-share trim; below this, work it patiently rather than crossing)
- filing watch: 10-Q until 2027-03-09 (deck-provisional: Q3 filing is the whole case: RPO growth >20% AND net adds ≥6,000, or NRR ≥103%, re-adds the half; ad)
- dated pack HUBSI2026-08-05: HubSpot Q2: revenue > \$898M guide + raise; billings/cRPO health.
- dated pack HUBS-STKI2026-08-05: HUBS stock-reaction call: compare the close 5 TRADING DAYS after the print to the pre-print close. HIT = higher, MISS = flat/lower. Mechanic
- dated pack HUBS-TRIMI2026-08-12: TRIM-INTO-STRENGTH (re-court 5/10 HOLD-REDUCED, business_risk+data_integrity -> size cut, cap re-derived 1.2%->0.5%): instr 149 = SELL 51 @
- dated pack HUBSI2026-11-05: Re-court frozen call (0.45, frozen 2026-08-05 POST-transcript-check pending - freeze confirmed only after the transcript recheck): at Q3 pri
- dated pack HUBSI2026-11-04: HUBS Q3 print (date UNCONFIRMED, vendor): grades the trim-50. RE-ADD half: 10-Q RPO growth >20% AND adds ≥6,000, or NRR ≥103%. KILL remain
- dated pack HUBSI2026-08-12: HUBS: Armed trim-50 executes (instr 149) — reconcile 51-share instruction vs 42 shares held, and check tax lots first (date confirmed=True)

- dated pack HUBSI2027-02-13: HUBS: end of the standing 10-Q/10-K filing watch window (date confirmed=False)

What remains unverified

1. **Q3 print date.** 2026-11-04 is vendor-derived; no company PR names it. Not drainable until HubSpot's IR release. *Estimate:* 2026-11-03 to 2026-11-05, from the issuer's own Q3 history of early-November prints; $p \approx 0.70$ that it lands on 11/04 exactly.
2. **Invoicing and deferred-revenue balance at 6/30/26** (the billings series, and the size of the customer-prepayment haircut to "net cash"). Drainable now from the Q2-26 10-Q already in the pack (0001193125-26-335232) — neither bench actually opened it.
3. **Chain-level midpoint IV and real bid/ask for Dec-2026 strikes, plus the IV percentile.** Drainable now via the broker chain. Everything in the vol section below rests on an aggregate feed we are not allowed to price strikes off.
4. **Tax lots behind the 42 shares.** The 186.7875 is a blended average; the short-term/long-term split is unknown and it changes the after-tax proceeds of the 21-share sale. Drainable now.
5. **Q3 net adds and NRR.** Private until 11/04. *Estimate:* adds 5,000–6,200, NRR 101–103%, anchored on the company's own 5–6k / flat-102% guide adjusted slightly down for the historical pattern of guiding to the achievable; $p \approx 0.55$ that adds land inside the guided band and $p \approx 0.25$ that the $\geq 6,000$ re-add gate clears.
6. **Q3 repurchase pace and cash+investments at 9/30/26.** Private until the 11/05 10-Q. *Estimate:* \$250–450M repurchased, cash+inv \$1.15–1.35B, extrapolating the \$200M/qtr H1 net draw; $p \approx 0.35$ that the ">\$300M with cash <\$1.2B" trim gate fires.
7. **FX contribution to H2 reported growth.** desk/seasonality.py was unavailable to both benches and no FX series was pulled. *Estimate:* 2–3pp of tailwind in Q3 decaying to 1–2pp in Q4, derived from the H1 reported-20% vs cc-17% spread rolling against harder comps; $p \approx 0.50$.
8. **Rule 10b5-1 adoption dates behind the 9/2 Form 4s and the 8/4 / 8/18 Form 144s.** Drainable now from the filing footnotes.
9. **Current short interest.** 5.01M shares / 10.05% is secondary and dated; the squeeze leg of the pre-mortem depends on it being live. Drainable now from the exchange settlement file.
10. **Average daily volume.** The reflexive leg above assumes ~1.2M shares/day. Assumed, not measured. Drainable now.

PRIZE TABLE + VOL READ

Table (anchored on the benches' own bear/base/bull, then adjusted; spot \$224.515):

scenario	what has to happen	price	p	contribution
Bear	Adds <5,000 or NRR <102%; FX help fades; multiple to 2.0x EV/S	\$170	0.25	\$42.50
Base	Guide met, ~11% cc exit rate, 3.2x EV/S	\$265	0.50	\$132.50

scenario	what has to happen	price	p	contribution
	hold			
Bull	Adds $\geq 6,000$ and NRR $\geq 103\%$, re-rate to 4.5x EV/S plus a short squeeze	\$360	0.25	\$90.00

EV = \$265.00 = +18.0% from the pack tape. (Red computed +16.2% off a tape that isn't in the pack; blue computed +17.8% off a different tape that also isn't in the pack. Both are the same error, in the same direction, by different amounts.) Downside is -24.3% . On the **21 shares we keep**, the expected gain is about **\$850** and the bear branch costs about **\$1,145**. That is the honest scale of this position: it is a rounding error on the book, which is itself an argument that the trim was correct and a further argument that no complex expression is worth the operational risk.

Vol read. Reported IV 63.6 vs RV 105.8 $\rightarrow$ headline **VRP = -42.2 points**. But the RV window contains the -20.2% August 5 gap, which on its own annualizes to ~ 70 vol; strip it and clean RV $\approx$ **79.3**, so the honest **VRP ≈ -15.7 points** — implied is modestly *below* clean realized, not screaming rich. IV percentile: **not pulled (unverified item 3)**.

Expression math, shown. Table dispersion: $\sigma_{\text{table}} = \67.2 (29.9% of spot) around the \$265 EV. Implied dispersion to a Dec-2026 expiry ($T \approx 0.30$): $0.636 \times \sqrt{0.30} \times 224.5 = \78.2 ; to Jan-2027 ($T \approx 0.35$): **\$84.5**. So the chain implies a wider spread than our table — which normally says *sell* premium.

Now price two strikes off the table itself, $C_{\text{ours}} = \sum p_i \times \max(S_i - K, 0)$:

strike	C_ours (from the table)	model price @ 63.6 IV, Dec-26	implied vol our table would pay
260	\$27.50	\$19.52	80.1
280	\$20.00	\$14.54	75.5

Those two comparisons **disagree** — total dispersion says options are expensive, but the individual upside strikes look cheap against our table. That disagreement *is* the bimodality: the table is fork-dated on 11/04, so its mass sits in two lumps (\$170 and \$360) with a hole in between, and a lognormal chain systematically underprices the right lump even while pricing more total variance. Fork-dated tables break single-number vol comparisons; noting it rather than picking whichever number flatters the trade.

Instrument recommendation — output of the arithmetic: STOCK ONLY. Execute the trim in shares. No options. Reasons, in order: 1. **The 80-vol breakeven is inside the noise between an aggregate feed and a real chain.** Our table only pays for the Dec-26 260 call if chain midpoint IV is below ~ 80 . The aggregate feed says 63.6, which would imply $\sim \$8$ of edge — but that feed is the exact input doctrine forbids for strike pricing (TSSI: 71 on the aggregate, 101 at the strike). A post-crash SaaS name with an earnings print inside the expiry can easily carry 75–85 vol at a 40-delta strike, which erases the entire edge. **No real quotes were pulled by either bench, so the edge is unmeasured, not present.** 2. **Buying calls now front-runs our own gate.** The re-add is conditioned on 11/04 data. A pre-print call is a bet on the fork, not on the gate — it contradicts the

adjudication's business-risk→size-cut logic. 3. **Covered calls are mechanically impossible.** Post-trim we hold **21 shares**; a contract needs 100. Cash-secured puts would add exposure we just voted to cut. 4. **Tax overlay.** The loss branch must land in the intended tax year. A **Jan-2027** expiry pushes any loss into 2027 and is therefore **excluded during a harvest year** — and the numeric edge does not dominate, since it is unmeasured (point 1). The only tax-compliant expiry that still contains the 11/04 fork is **Dec-2026**, and at Dec-26 the model price is *lower* (\$19.52 vs \$22.13), i.e. less premium to be wrong with. Separately, the share trim realizes a **gain** of roughly \$792, not a loss, so harvest-year exclusion does not block the trim itself — but lot selection does matter: sell the highest-cost lots first, and confirm the long-term/short-term split before the ticket goes in (unverified item 4).

If the chain is pulled and Dec-26 260C midpoint IV prints ≤ 70 with a tradeable spread, and the 11/04 data gate clears, the re-add may be expressed in Dec-26 calls instead of shares. Until that quote exists, this is a share position and nothing else.

ADJUDICATED — HOLD — NO ADD

Thesis REJECTED for HUBS as an unpriced dislocation: the company guided Q3 1.7% below the street and the street already models 13% three-year growth; net of ~\$490M SBC, owner FCF is ~1.7% of EV; the buyback is SBC settlement, not a cushion; IV below realized is the mechanical post-print vol crush, not “flow”. What survives (blue): GAAP-profitable, zero debt, \$1.4B cash, 10% short interest gives squeeze asymmetry into the print, and a billings series IS derivable from the 10-Q deferred-revenue invoicing line (red called it uncheckable). Red’s own position line was hold-no-add, which is not a reject. HOLD the 42 shares (the trim-50 from the August court was already executed); no add.

GATES: Q3 10-Q: cc calculated-billings growth $\geq$ cc revenue growth (invoicing line) AND RPO $\geq$ \$1.9B · Net adds $\geq$ 6,500 with NRR $\geq$ 102% and ASRPC accelerating in constant currency · Q3 buyback $\leq$ \$150M with cash+investments flat-to-up (self-funded)
