

PITCH — IMRX — VERDICT

ADJUDICATED 2026-09-16 — FLAT — human-gated (conviction 7/10). The court found nothing to own at this price; the reopen gates below are the only path back.

What we believe

Immuneering (CIK 1790340) is a pre-revenue, one-asset cancer-drug developer whose stock is half off its 52-week high (\$5.04 vs \$10.08) and sitting on a lot of cash relative to its size. Cash was \$182.7M at 6/30/26 against a market value of about \$326M (Class A only) to \$338M (adding the small Class B block) — so more than half the price is cash in the bank. Primary source for the cash figure: the 8/5/26 earnings 8-K,

<https://www.sec.gov/Archives/edgar/data/0001790340/000179034026000088/imrx-20260805xexx991.htm>, and the Q2 10-Q,

<https://www.sec.gov/Archives/edgar/data/1790340/000179034026000091/>.

What we actually believe, stated narrowly:

1. The real burn is about \$17.15M per quarter, not \$20M. That is filed arithmetic: cash went \$217.0M (12/31/25) → \$182.7M (6/30/26), i.e. \$34.3M in six months. At that rate the money lasts roughly 10.6 quarters — into the first half of 2029 — which matches the company's own "into 2029" language.
2. The business value net of cash is therefore about \$156M–\$168M. That is a modest price for a Phase 3 pancreatic-cancer program, but it is **not** a giveaway.
3. The "cash floor" people lean on is softer than it looks. Founders control the votes through Class B, the mandate is one drug, and management will spend to the readout. Outside holders have no lever to force cash back. The floor that is actually enforceable is the *leftover* cash at the readout — roughly \$25M–\$45M — plus scrap value, not today's \$2.5–2.8 per share.
4. A stock sale before the readout is probable, not certain, and it will likely be priced off a depressed tape.
5. Net of all that, our own scenario math gives about \$4.23 per share of expected value against a \$5.04 tape. That is a fair-to-slightly-rich price. We are not owners here yet.

What the market believes

The market has voted twice on this company's own data — roughly –21% in early January and –23% around June 1–2 (both event dates are **unverified** in our pack; we have no price series, only the 52-week extremes). The read implied by those moves is that 17.3-month median overall survival in 55 selected, fitter patients, with a confidence interval whose top end is not yet reached,

is not clearly better than the decade-old standard-of-care benchmark. The market also appears to be pricing a dilution event: the stock has retraced only 19% of its peak-to-trough range $((5.04-3.86)/(10.08-3.86))$, so it is trading nearer the panic than the recovery.

Honest caveat: neither bench could produce a single published outside estimate — no probability-of-success number, no peak-sales range, no coverage count. “The market believes X” is, for this name, an inference from two price moves, not a measured consensus. An uncovered \$326M microcap can be wrong for a long time in either direction.

Why we might have edge

- **Arithmetic edge over the loudest bear version of this story.** The bear case circulating internally used a \$20M/quarter burn that appears in no filing; it is our own stress input. At the filed \$17.15M, runway extends about three quarters further and the “raise into a blackout with one quarter of cash left” story loses its teeth. Anyone trading the \$20M number is trading a number the company never printed.
- **Gross-to-net reconciliation nobody did.** Q2 gross operating expense was \$14.0M R&D + \$5.0M G&A = \$19.0M, yet net cash only fell about \$17.15M. The ~\$1.85M/quarter gap is non-cash stock comp (roughly \$1.7–2.0M/quarter) plus interest earned on ~\$180M of cash (roughly \$1.8M/quarter). That wedge is exactly why “into 2029” is a true statement rather than promotional.
- **Balance sheet inside the payoff table.** The bear prize table valued the drug and forgot the cash. Adding \$182.7M back moves the worst realistic funded cell from about \$0.90 to about \$3.58 per share and puts three of nine cells above +50%. The downside tail was understated as badly as the upside.
- **A dated, cheap test.** The 11/11 print (date unconfirmed) settles three things at once for free: share count, cash, and whether R&D is ramping. We can be flat and still be first to know.

Why it might be priced in

- Two derates on the company’s own data is the market doing the work. There is no obvious new fact in our hands that the tape has not seen.
- More than half the market value is cash. That is a well-known screen; net-cash biotechs are not an undiscovered category, and the reason they trade there is precisely the dilution and no-forcing-mechanism problem we describe.
- Every number in our payoff table — the 1.9× peak-sales multiple, the launch year, the success probabilities — is analyst-constructed and unverified. We are not disagreeing with a measured consensus; we are substituting our guesses for guesses we never read.
- The entry is +30.6% off the low. If the dislocation was the trade, we missed the good part of it.
- Nothing value-bearing is scheduled to print for roughly 21 months. Being right early is indistinguishable from being wrong.

What could go wrong

Failure narrative 1 — Dilution at the drawdown low (has a tripwire). The company raises \$100–150M in 2027 at a 10–25% discount because it must fund enrollment, and there is no good news to raise into. Share count goes ~67M → ~90M+, every per-share cell in the payoff table compresses by 15–25%, and the offering resets the tape lower for months. Tripwires exist and are cheap: an S-3/424B5, an ATM prospectus supplement, an 8-K, or a jump in the 10-Q cover-page share count.

Failure narrative 2 — Silent clinical degradation, no tripwire at all (unknown-unknown class: CLINICAL OPACITY / silent-state failure). Enrollment slows, a safety-monitoring committee quietly narrows or re-randomizes, sites drop, or the internal view of the survival curve deteriorates — and none of it is disclosed because none of it is individually material. There is **no monitorable signal** between now and the readout. Registry text and site counts are a weak proxy at best and sponsors update them late. This is the class of failure where our sensor list cannot help by construction: the state of the asset is private for 21 months, and the first public datum is also the terminal one. We should size as if we are blind here, because we are.

Failure narrative 3 — The floor was never a floor. The readout misses, the company arrives with \$25–45M, and dual-class control means no wind-down, no return of capital, no activist path. The stock does not stop at cash-per-share; it goes to scrap-plus-a-story, call it \$0.60. Partial tripwires only: 13D/G changes, Form 4 sale codes, any governance or capital-return announcement — none of which is reliable.

Reflexive and structural leg (stated plainly, including what we don't know). We do not have average daily volume, short interest, or borrow — that is a real coverage gap, not a rounding error. Base-rate estimate for a \$5 stock with a ~\$330M cap: 400k–900k shares/day, i.e. \$2–4.5M notional. A quarter-unit (0.25% of book) starter is small in absolute terms but plausibly 10–20% of one day's volume, and the exit is into the same order book the company's own at-the-market program will be selling into. In a stock where the issuer is a structural seller, our size is not the reflexive problem — *their* size is, and we are junior to it.

Predicted flow, in order of likelihood: issuer at-the-market selling into any strength; December tax-loss selling in a name already down 50%; offering-related hedging pressure if a deal is marketed; nothing supportive from index or ETF demand at this cap.

Doctrine interaction — this is the part that should worry us most. Two of our own patterns fire on this name simultaneously and in *opposite* directions: “buy the net-cash floor” says support at \$2.5–2.8, while “cash floor without a forcing mechanism” says the enforceable floor is roughly 7× lower. If we hold several dual-class, single-asset, cash-heavy names sized off the first doctrine, they will all fail together for the same structural reason, and our book-level diversification is an illusion. Related: the “financing squeeze inside an evidence blackout” pattern and the “spend-to-readout with no forcing mechanism” pattern are the same trade seen from two ends; do not count them as two independent confirmations.

If this position loses money, the most likely reason will be ____

(___ = we paid a fair-value price for a private, 21-month-gated asset and were diluted at the drawdown low before any datum could re-rate it.)

What we checked ourselves

Claim	How checked	Found	Confirmed?
Cash \$182.7M at 6/30/26	8-K Ex-99.1 8/5/26 (primary)	\$182.7M	Yes
Burn is \$20M/quarter	Roll-forward \$217.0M → \$182.7M over H1	\$34.3M/2 = \$17.15M/qtr ; the \$20M was <i>our own</i> stress input, never filed. Our red bench built a FATAL kill on it.	No — our error
Runway ends ~Q3 2028 (“at the readout”)	\$182.7M ÷ \$17.15M	~10.6 quarters → H1 2029 , matching the filed “into 2029”	No — our error
Cash today ≈ \$165M, \$2.55/sh	68 of 92 days of Q3 elapsed × \$17.15M	~\$170.0M , \$2.54/sh on 67M shares. Our red bench over-decayed by ~\$5M.	Direction yes, size no — our error
Enterprise value ≈ \$144M	Cap minus current cash	\$156M (Class-A cap) to \$168M (A+B cap)	No — corrected
\$2.82/sh net cash	Q2 XBRL: Class B contexts live at 6/30/26	Class-A-only division. A+B ≈ 67M → \$2.72/sh , a 3.5% error. Both benches then reused Class-A-only counts in their own tables — same error, twice.	No — our error, both sides
“ATM member context in the Q2 10-Q proves issuance”	Read the pack excerpt in full	The same <code>imrx:AtMarketOfferingMember</code> is tagged for 2025-01-01 → 2025-06-30 as a comparative. A member context appears for any tagged fact, including zero. Our red bench’s finding 4 is overturned as evidence.	No — our error
“Half the drawdown is retraced”	(5.04–3.86)/(10.08–3.86)	19% , not ~50%. Fact (+30.6% off low) stands; the gloss does not.	Fact yes, gloss no — our error
“The roof is already priced” (prize table)	Re-ran the bear table with cash added back	\$300M/10% = \$3.58 not \$0.90; +50% clears in 3 of 9 pre-raise cells. Table had omitted the balance sheet while a separate finding spent a whole page marking that cash to time.	No — internally inconsistent
Insiders are selling / grants reset payoffs	Filing cadence only (transaction codes unfetchable)	Five Form 4s on 6/11 plus an 8-K reads as an annual board grant cycle; 7/16 Form 3 + 7/17 Form 4 reads as a new officer. No sale codes evidenced.	Unresolved — downgraded to neutral
Net cash is a downside floor	Governance read: Class B voting control, single-asset	Not a floor. Enforceable floor is terminal cash at readout	Yes — against us

Claim	How checked	Found	Confirmed?
	mandate	(\$25–45M) + salvage. This is the one place the bear case was too gentle.	
Street expectations diverge from ours	Attempted extraction of any published estimate	Zero outside numbers found, by either bench. Divergence is asserted, not measured.	No — open
Pack XBRL series (revenue/SBC/diluted shares/operating cash flow)	Date check	Newest rows are 2025 or older; stale for this quarter's math. Both benches discarded them. Retained only SBC magnitude (~\$1.7–2.0M/qtr) as a sanity check on the gross-to-net wedge.	Discarded — noted
Live fetches (EDGAR full-text, ClinicalTrials.gov, IBKR bars, price series, options chain)	Attempted in both benches	All failed — no egress. Every number here is pack-primary or arithmetic on it.	Gap — disclosed
SCIENCE BRIEF supplied?	Input inspection	The SCIENCE BRIEF block is empty . Per the deep-tech rule, the SCIENCE BRIEF DIGEST section is omitted rather than invented. Flagging it: for a clinical-stage name this is a <i>content</i> gap, and if a brief exists upstream this deck should be re-run with it.	No brief — section omitted

PROPOSED ENTRY BANDS

Both courts say NO ENTRY at \$5.04. Reopen bands below, all drawn from the benches' own arithmetic. Sizing convention: 1 unit = 1.0% of book.

- **No immediate entry.** Expected value from our own table is **\$4.23** vs a \$5.04 tape (–16%). Do not chase, do not scale in on strength.
- **Reopen band 1 — \$3.90 or lower: quarter-unit (0.25% of book), limit only.** \$3.90 is roughly the time-adjusted net cash mark and roughly the \$300M-peak / 10%-success floor cell (\$3.58). **Gated** on the 11/11 print showing all three of: Class A $\leq$ 65.0M shares, cash $\geq$ \$165M, R&D $\leq$ \$16M/quarter. If any of the three fails, the limit is cancelled, not lowered.
- **Reopen band 2 — \$2.60 or lower: add a second quarter-unit (0.50% total).** At/under the by-print net cash mark (\$2.35–2.43/sh at 11/11 on the filed burn rate), which is where the asymmetry the bull case claimed at \$5.04 actually exists.
- **Size cap: 0.50% of book** unless a non-dilutive funding event lands (see below). Hard cap 0.75% even then. Justification for the small cap: failure narrative 2 has no tripwire, and the position is blind for ~21 months.
- **Unlock to 0.75%:** an 8-K disclosing a partnership, royalty, or regional license covering $\geq$ \$120M of Phase 3 cost, **or** a disclosed interim survival analysis with a stated date before mid-2028 on <https://clinicaltrials.gov/study/NCT07562152>. Either one converts an untradeable blackout into a dated window.

- **Cancel/abandon:** cancel all standing limits on (a) an offering priced below our working limit, (b) any Class A count materially above ~66.5M at the print, (c) a tape above \$6.30 (+25%) with no new disclosure — at that point we are paying for the same optionality 25% higher.
- **Exit/trim if filled:** trim half on any move above ~\$7.25 pre-raise (the \$800M-peak / 20%-success cell) absent a raise; exit fully on program discontinuation or on a raise that pushes share count above ~95M without a partner.
- **Catalyst dates:** 2026-11-11 Q3 print (**UNCONFIRMED** — yfinance-derived per the pack; no company press release in the filing inventory names it; cadence-consistent with 11/12/25, 5/15/26, 8/5/26). ~45 trading days out, so the print-decisive race is **not** triggered. 2026-12-31 tax-year boundary (confirmed, calendar). January 2027 GI cancer meeting window (unconfirmed; the January derate suggests this is a live venue). Mid-2028 registrational topline (unconfirmed date).

ARMED SENSORS

(armed provisionally with this deck; session adjudication ratifies)

- price alert: fires below 2.6 (deck-provisional: at/under the by-print net cash mark (\$2.35-2.43/sh at \$17.15M/qtr burn); second quarter-unit, restores)
- filing watch: S-3,S-3ASR,424B5,8-K until 2027-03-06 (deck-provisional: dilution tripwire: any shelf, ATM supplement or offering 8-K is the primary failure narrative going li)
- dated pack IMRX|2026-11-11: IMRX: Q3'26 print — tests Class A <=65.0M, cash >=\$165M, R&D <=\$16M/qtr; ~45 trading days out, print-decisive race not triggered (date confi
- dated pack IMRX|2026-12-31: IMRX: tax-year boundary — only expressions resolving on/before this date keep the loss branch in the harvest year (date confirmed=True)
- dated pack IMRX|2027-01-21: IMRX: January GI cancer meeting window — venue implied by the ~21% early-January derate; date is a placeholder (date confirmed=False)
- dated pack IMRX|2028-06-30: IMRX: MAPKeeper 301 registrational topline — the single value-bearing datum, ~21 months out (date confirmed=False)

PRIZE TABLE + VOL READ

Required here because the load-bearing unknowns are genuinely time-gated and private: the clinical state of the asset (private until 2028), the raise terms (private until priced), and outside expectations (unpublished/unfetchable).

Payoff grid — inputs are the bear bench's own (1.9× peak sales, launch 2029, 67M shares pre-raise / 92M post a ~\$100M raise), corrected only by adding the \$182.7M of cash the original table dropped. Every input is **analyst-constructed and UNVERIFIED**; the multiple is assumed, not derived.

Peak sales	Success 10%	Success 20%	Success 35%
\$1.5B	\$6.98 / \$6.17	\$11.23 / \$9.27	\$17.61 / \$13.92
\$800M	\$5.00 / \$4.72	\$7.26 / \$6.38	\$10.67 / \$8.86

Peak sales	Success 10%	Success 20%	Success 35%
\$300M	\$3.58 / \$3.69	\$4.43 / \$4.31	\$5.70 / \$5.24

(pre-raise / post-raise per share)

Scenario × probability × price, anchored on the tape (\$5.04) and adjusted, horizon ~1.75 years to the mid-2028 topline:

Scenario	p	Price	Contribution
Clear win, ≥\$1.5B peak credible, post-raise	0.08	\$9.30	\$0.74
Modest/partial win, ~\$800M peak re-rate	0.17	\$7.20	\$1.22
Muddle-through: no data, raise executed, drifts near cash	0.40	\$4.20	\$1.68
Miss or program halt: terminal cash + salvage, no forcing mechanism	0.30	\$0.60	\$0.18
Non-dilutive partnership / license / takeout before readout	0.05	\$8.00	\$0.40

EV = \$4.23 vs \$5.04 tape (−16%). That is the arithmetic reason this deck proposes no entry. EV crosses the tape only if the miss branch drops below ~0.24 or the muddle price rises above ~\$6.30 — neither is supportable today.

Dispersion and vol read. Table standard deviation $\sigma_{\text{table}} = \2.87 , i.e. **56.9% of spot** over 1.75 years $\approx$ **43% annualized-equivalent**. A stock like this typically carries implied vol far above that (biotech microcaps commonly 80–110%). **We could not retrieve a chain — no egress — so we do not know whether one exists, and we have no chain-level midpoint vol, no realized vol series, and no vol percentile.** That is unverified item 5 below, not a conclusion.

Expression math, priced off the table itself (undiscounted, to the readout):

- $C_{\text{ours}}(K = \$7.50) = 0.08 \times \$1.80 + 0.05 \times \$0.50 = \mathbf{\$0.17}$. Any quoted long-dated \$7.50 call above ~\$0.20 is a losing purchase on our own numbers.
- $C_{\text{ours}}(K = \$5.00) = 0.08 \times \$4.30 + 0.17 \times \$2.20 + 0.05 \times \$3.00 = \mathbf{\$0.87}$ (~17% of spot). An 18-month at-the-money call at 90% implied vol would cost roughly \$2.00+ — roughly 2× our fair value.
- $P_{\text{ours}}(K = \$4.00) = 0.30 \times \$3.40 = \mathbf{\$1.02}$ to the readout. Puts are *expensive-fair* on our table because the miss branch is severe; selling long-dated puts here is selling the exact tail we say is underpriced. Do not.
- Short-dated is different, and this is where the fork matters: the miss branch cannot resolve inside a 3–4 month window, so a **December-2026 or March-2027 \$4.00 cash-secured put** collects premium against near-zero table-mapped intrinsic. Conditional recommendation only:

sell only if the premium is $\geq \$0.15$ and the net assignment basis is $\leq \$3.85$ (inside reopen band 1), and only after the 11/11 gates pass.

- **Bimodality:** the table is fork-dated on a single mid-2028 event — two clusters at $\sim \$0.60$ and $\sim \$7-9$, almost nothing in between at that date. A single-vol lognormal model prices drift, not a fork; near-dated options therefore misprice the event and long-dated options embed a smile we cannot see without the chain. Treat any single implied-vol number as unusable for the 2028 expiry.
- **Instrument output of the above arithmetic: STOCK, limit orders only, at the reopen bands.** Long calls fail on price (2x our fair value at the money, $\sim 5\times$ out of the money). Long-dated premium selling fails because it shorts our own tail. Short-dated cash-secured puts are the only options route with positive arithmetic, and they are **gated and unpriceable today** because no chain data exists. Covered calls are moot with no position.

Tax overlay. 2026 is a harvest year. The loss branch of this trade resolves at the mid-2028 readout, so any long-dated expression pushes the loss into 2028 or later — deferred out of the intended tax year and therefore **excluded** unless the edge numerically dominates. It does not: EV is 16% *below* the tape. The short-dated December-2026 put is the only expression whose loss branch lands in the current tax year, which is a second, independent reason it is the only options structure on the table.

What remains unverified

1. **Q3'26 cover-page Class A share count** — settles whether any at-the-market selling occurred. Not drainable now (the document does not exist until the print). Estimate: 64.7M–66.5M shares; $p(\leq 65.0\text{M}) \approx 0.55$.
2. **Cash balance at 9/30/26** — tests our \$170.0M roll-forward. Not drainable now. Estimate: \$165M–\$171M, $p \approx 0.70$.
3. **NCT07562152 registry footprint** — site count, enrollment status, completion date, and above all whether any interim survival analysis is scheduled before mid-2028. Drainable now with egress; this is the highest-value single read in the file and neither bench could open the URL it cited.
4. **Liquidity: average daily volume, short interest, borrow** — drainable now via broker feed. Blocks responsible sizing until drained.
5. **Options chain existence and chain-level midpoint implied vol with real strike quotes** — drainable now via broker feed. Must be chain-level, not the aggregate underlying feed.
6. **SC 13G 0002012383-26-002523 (7/28/26)** — who the $\geq 5\%$ holder is and how large, for overhang. Drainable now via EDGAR.
7. **Form 4 transaction codes, 6/11–7/17/26** — grants versus open-market sales. Drainable now via EDGAR; the insider question is unresolved only because of the fetch gap.
8. **Outside expectations for the operative period** — any published success probability or peak-sales range, plus how many analysts cover the name. Not drainable now (private/paywalled notes; likely only 2–3 covering firms). Estimate from base rates: peak sales \$400M–\$1.0B;

success probability 10–20% (industry Phase 3 oncology base rate ~35%, first-line pancreatic historically well under 15%); $p \approx 0.60$ that the true consensus sits inside that box.

9. **Terms, size, and timing of the expected equity raise** — not drainable now (private until priced). Estimate: \$100M–\$150M at a 10–25% discount, some time between H1 2027 and H1 2028; $p \approx 0.75$ that a raise of $\geq \$75\text{M}$ is completed before the topline.
10. **The 2026-11-11 print date itself** — flagged UNCONFIRMED in the pack, yfinance-derived, no company press release names it. Not drainable now. Estimate: 11/09–11/17/26, $p \approx 0.80$.

```

ADJUDICATION — 2026-09-16 15:37Z

Pre-topline raise probable inside the 21-month evidence blackout; the net-cash “floor” is not a floor under Class B control (blue NEW-B). Fairly-paid risk, not a bargain. Dev-stage: nothing stages without a principal gate.

REOPEN GATES: paper court-on-touch $\leq$ \$3.90, gated on the 11/11 cover page: Class A $\leq$ 65.0M, cash $\geq$ \$165M, R&D $\leq$ \$16M/qtr
