

PITCH — INFY — VERDICT

ADJUDICATED 2026-09-16 — PASS — FX-subsidised margin (conviction 7/10). The court found nothing to own at this price; the reopen gates below are the only path back.

What we believe

We believe three things, and only the third is strong.

1. **The idea that got INFY on the page is dead.** The pitch started as “a –63% drawdown in a \$46bn cash-generating services franchise means the market has priced terminal AI disruption.” That input does not survive. The 52-week-high rail of \$29.36 is arithmetically incompatible with the local listing: ADSs are 1-for-1 with equity shares, the NSE 52-week high was ₹1,728, and at 84.5–95 rupees to the dollar a \$29.36 ADR implies a local price around ₹2,480 — roughly 44% above a high that never happened. The honest drawdown is local –34.4% times FX –10.6%, or about **–41%** (range –38% to –45%). The “excess drawdown” of –28pp that generated the idea was manufactured by a bad data field.
2. **At ~14.7x trailing earnings on flat-to-2% growth, the stock is roughly fair.** Not cheap, not dislocated. We cannot claim mispricing when the multiple matches the growth story.
3. **The one real deterioration in the file argues bear, not bull.** The rupee fell about 11% year-over-year into the June quarter. Management has historically quantified roughly 1.2pp of margin from a 4.9% average rupee move — about 24bp per 1% — which implies a **+250 to +400bp** currency tailwind. Reported margin went up **30bp** (20.8% → 21.1%). The gap, roughly **200–370bp of underlying operational or pricing erosion**, is the only confirmed damage signal in the court, and it is hidden by the currency rather than revealed by it.

So: we believe there is a real story here, and it is a *short-quality* story on margins that we are not equipped to trade, not a long-dislocation story.

What the market believes

The market appears to believe INFY is a stable, low-growth, high-cash-return exporter worth mid-teens earnings: 14.5–15.4x on the local line, 14.74x on the ADR as of 2026-09-04. That is a coherent view and it is consistent with the company’s own guidance of 1.5–3.0% constant-currency growth for FY27 after 2–3% for FY26 — flat at the midpoint, a halving only at the low rail.

What we cannot say is whether we disagree with anyone. Neither bench could pull a street consensus revenue or EPS point-and-range for the September quarter. Without that anchor we are describing the market’s view from the multiple, not measuring a divergence from it. That is an asserted consensus, not a measured one, and it blocks any accept on its own.

Why we might have edge

Honestly: thin, and mostly analytical rather than informational.

- **Decomposition discipline.** Very few holders of a dual-listed ADR separate the drawdown into local price, currency translation, and receipt basis. Doing that turned a “–63% catastrophe” into “–41%, most of it a rupee and a normal bear market.” That is a repeatable process edge on every ADR/GDR screen we run, and it is now a detector candidate.
- **The FX-adjusted margin lens.** The street reads 21.1% and calls margins resilient. Adjusting for the currency tailwind that should have delivered 250–400bp says the underlying business gave back 200–370bp. If that view is right and not yet widely held, it is a genuine edge — but it points at avoiding or shorting the name, and we do not currently have the FY27 sensitivity disclosure needed to size it.
- **Rail integrity as a screen input.** We caught a corrupt data field before sizing. The edge is in *not* taking the trade.

That is the full list. There is no proprietary channel work, no client-check, no supply-chain read.

Why it might be priced in

Almost everything in this file is either public or arithmetic anyone can do:

- The guidance range, the 21.1% margin, the \$5,082m quarter, the \$3.6bn of new deal value with 61% net-new, and the 8.2% AI revenue mix all sit in the press release exhibits of the 6-K, not just a transcript. Everyone has them.
- The rupee’s slide from ~84.5 to ~94.5–95.6 is the most-watched macro series in the Indian market. Nobody is surprised by a currency tailwind to margins.
- The ADR-versus-local basis is arbitrated two ways by the depositary. Whatever gap exists today — somewhere between 0% and –8% depending on which timestamps you pair — is a plumbing and timing artifact, not a re-rating opportunity waiting to be harvested.
- The 85%-of-free-cash-flow return policy is published, and the withholding tax treatment of dividends and (post-2024) buyback consideration is on the company’s own tax page. The advertised ~8.4% gross free cash flow yield is roughly **6.5–6.7% net** to a dollar holder before further currency drift. That is a fine carry and it is fully known.

The only plausibly-not-priced item is the ex-currency margin erosion, and even that is a calculation off public numbers.

What could go wrong

(the *PRE-MORTEM*, v1.7)

Failure narrative 1 — We enter on the reopen bands and the rupee turns. The bull case for a re-entry requires the September quarter to print margin at or above 21.1% *with the rupee flat-to-stronger*. If instead the rupee strengthens back toward 88–90, the 250–400bp tailwind reverses into a headwind and reported margin drops toward 18.5–19.5% while nothing changes

operationally. We buy an “FX-unsubsidised margin beat” that becomes an FX-punished miss two quarters later. **Tripwire: monitorable** — a USD/INR level gate and a margin-ex-FX tracker both catch it.

Failure narrative 2 — The guide walks to the low rail and the multiple follows the growth down. FY27 guidance is 1.5–3.0% constant currency with the first quarter at +2.4%, so the remaining nine months must run 1.2%–3.2%. If the mix drifts to the bottom, a 14.7x multiple on a 0–1% grower compresses to 12x or below — which is our own deep-value entry band at \$8.18–8.92, roughly 20–25% under spot. We would have bought “fair value” into a de-rating. **Tripwire: monitorable** — the guide revision itself, plus deal-value-to-revenue conversion.

Failure narrative 3 — the one with NO monitorable tripwire. The instrument we would own is not the company; it is a depositary receipt whose economics depend on custody, fungibility, registration mechanics, and the tax/treaty treatment of a cross-border payout — the same layer that already handed us a corrupt 52-week-high field. A change at that layer (a depositary fee or ratio change, a fungibility restriction, an Indian regulatory change to ADS conversion, an India–US treaty rate change, a data-vendor adjustment that silently re-bases our own history again) moves the price of our claim without moving a single line of the business, and **we have no sensor that would fire on it**. We would not learn about it from the tape, from a form we watch, or from a price gate; we would learn about it from the P&L. **Unknown-unknown class: instrument-plumbing / data-rail integrity risk** — the class where the *representation* of the asset fails rather than the asset. This class already bit us once in this very file, which is the strongest possible argument that it is under-defended. Note it is compounded by a second, adjacent class we also cannot monitor: **counterparty-side demand shock in labour arbitrage** — client-captive insourcing or a visa/immigration regime change that re-prices the delivery model, with no filing, form, or price level that flags it in advance.

The reflexive / structural leg. - *Our size versus liquidity.* We hold zero. The proposed reopen starter is 0.75% of book, maximum 2.0%. Against an estimated ADR average daily volume of 6–12m shares (roughly \$70–130m notional), that size is immaterial to price — but note the ADV figure is **estimated, not measured** (our price tooling was unreachable from both benches), and it is listed as an open item below. We cap any fill at 10% of trailing 20-day volume per day so that this stays true even if the estimate is 3x too high. - *Predicted flow.* The flow that would be alongside us is the wrong flow. A –41% ADR drawdown on a widely-held large-cap is exactly what screen-driven dip-buyers and yield-reaching retail buy, and a re-rating requires an institutional re-underwrite that a single in-line quarter does not deliver. Meanwhile the depositary arbitrage continuously erases any basis we might be paid for. We would be adding to a crowd that cannot move the multiple. - *Doctrine interactions.* Three of our own doctrines collide here. (a) The **excess-drawdown screen** generated this idea and will generate it again next week from the same corrupt field unless the rail validator is armed — a reflexive loop inside our own process. (b) The **print-proximity doctrine** did not trigger (the print is ~24–29 trading days out), which means the deck was written without the discipline that a near-print reconstruction would have forced. (c) The **“no accept without a measured divergence”** doctrine is what actually binds; the original brief recommended a starter position while simultaneously calling the currency split “the first job of a

court” — sizing ahead of its own binding unknown. That failure mode is the real risk to this deck: we build reopen bands, the rail gets cleaned, and we treat “the data is now correct” as though it were “the thesis is now true.”

If this position loses money, the most likely reason will be that we bought a fairly-priced, flat-growth exporter because a broken 52-week-high field made it look dislocated, and the currency that was quietly subsidising its margins turned against us before the operational erosion we already measured became visible to everyone else.

What we checked ourselves

Claim	How checked	Found	Confirmed?
dd52 of –63% is a verdict on the business	Decomposed into local price × FX × receipt basis	Local –34.4% (₹1,728 → ₹1,133.8), FX –10.6% (84.5 → 94.5); clean drawdown ≈ –41%	No — refuted. The premise of the idea is gone
hi52 \$29.36 is a real, adjustment-clean rail	1:1 ADS ratio × local high × contemporaneous FX; cross-check vs 3-year ADR return (–14.04%)	\$29.36 implies local ~₹2,480, ~44% above the actual NSE high; a >130% run then –63% collapse in a mega-cap is incompatible with a –14% 3-year return	No — rail ruled contaminated. Screen input invalid
OUR OWN ERROR (red bench): the –37pp residual is an “ADR premium collapse” from +43.6% to –9.4%	Blue checked the ADS ratio and today’s P/E rails (ADR 14.74x vs local 14.5–15.4x)	Rails agree within 0–5%. And “the product checks to –63.0% exactly” is a tautology — a three-factor multiplicative identity forces the residual to close no matter which rail is wrong. Red ran the fork and then wrote the <i>wrong branch</i> into the knowledge graph	Mechanism overturned. Conclusion (no dislocation) survives; explanation was wrong
OUR OWN ERROR (red bench): new ADS registrations (F-6EF 08-12, F-6 POS 08-28) created supply that crushed the premium	Read what an F-6 does	F-6 forms register ADSs against <i>existing deposited shares</i> ; no net equity supply is created, and two-way fungibility arbitrages any durable discount. Red’s proposed detector (“any F-6 within 6 months”) would false-positive on nearly every ADR alive	Overturned
OUR OWN ERROR (red bench): “USD revenue flat for three quarters; constant currency is the flattering basis”	Sequenced the actual prints: Q2 FY26 \$5,076m at +2.2% qoq ⇒ Q1 FY26 ≈ \$4.94bn; vs Q1 FY27 \$5,082m	Reported USD ≈ +2.8% yoy vs CC +2.4% — currency was a <i>tailwind</i> , so USD is the flattering basis , the opposite of the claim. The “three-quarter stall” was also measured off the seasonal peak quarter in the same document that declared seasonality unreachable	Refuted as a basis swap. The sequential plateau datum survives; the framing does not

Claim	How checked	Found	Confirmed?
OUR OWN ERROR (red bench): the rupee is both the excuse for the drawdown and pure carry loss	Blue's consistency check across findings 4 and 7	Rupee weakness is EPS- <i>accrative</i> for a dollar-revenue/rupee-cost exporter. You cannot use the same rupee to inflate margin in one finding and charge it as unambiguous loss in the next	Reduced — asymmetric. Net carry is ambiguous, not confirmed-negative
Margin resilience at 21.1% proves no pricing damage	Currency sensitivity: ~1.2pp margin per 4.9% average rupee move (company's own historical quantification) vs ~11% yoy move	Gross tailwind +250 to +400bp against +30bp realised ⇒ 200–370bp of underlying erosion	Confirmed in direction; magnitude plausible only (no FY27 sensitivity disclosure obtained)
~8% free cash flow yield is what we'd receive	Issuer tax pages + the payout policy exhibit	Non-resident dividends bear 20% withholding or treaty rate, and post-2024 buyback consideration is taxed as dividend; the 85% policy is <i>five-year cumulative</i> and explicitly "dividends and/or buyback." Net ≈ 6.5–6.7% , partially offset for US taxable holders by foreign tax credit	Confirmed, with the offset
FY27 guide implies deceleration	Guide arithmetic on the primary release	1.5–3.0% CC with Q1 at +2.4% ⇒ remaining nine months 1.2%–3.2%. FY26's own guide was 2–3%, so FY27 is ~flat at midpoint, a halving only at the low rail	Range confirmed; deceleration not confirmed at midpoint. Correctly non-load-bearing
Backlog is not converting ("rpo_drift" analogue)	Deal-value vs revenue	FY26 total contract value \$14.9bn on >\$20bn revenue; Q2 FY26 \$3.1bn vs Q1 FY27 \$3.6bn — TCV is up . Red's "backlog not converting to revenue" re-based: the drift is backlog-to- margin , not backlog-to-revenue	Red's version corrected; adapted detector still fires
The print is 2026-10-23	Scanned the 6-K stream and company newsroom	No company intimation names it; prior-year Q2 printed 2025-10-16 , so the true date is plausibly ~a week earlier	Not confirmed — yfinance-derived
Disclosure venue discipline	Cross-venue check	21.1% margin, \$5,082m, \$3.6bn TCV / 61% net-new, 8.2% AI mix all appear in Exhibit 99.1/99.2 press releases , not transcript-only — venue match	Confirmed clean
BOTH BENCHES' GAP: we know the consensus	Attempted consensus pull from both benches	Failed. No Q2 FY27 street revenue/EPS point-and-range	Not confirmed — joint coverage gap. Blocks accept
BLUE'S OWN SOFT SPOT: the rail kill rests on primary	Traced blue's sources	The 3-year-return cross-check came from a	Provisionally confirmed; needs an exchange-grade

Claim	How checked	Found	Confirmed?
data		secondary data site, not a primary filing or an exchange series. The kill is arithmetically strong but is not yet primary-sourced	series
Market cap / share count coherence	Red's ₹4,39,100cr = \$46.5bn back-solved	Implies ~3.87bn shares vs ~4.1bn outstanding — a ~6% discrepancy neither bench resolved	Not confirmed
XBRL-based share-based comp / share count / operating cash flow math	Pack's XBRL block	Empty. No such math was possible from either bench	Not checked — data gap, not a kill

PROPOSED ENTRY BANDS

Both courts say no entry. Size today: 0.0% of book. No orders. What follows are the **reopen bands**, priced off the benches' own arithmetic (trailing EPS back-solved from 14.74x at \$10.96 ≈ \$0.74).

Reopen Gate A — data integrity (blocking, non-price). No entry of any size until an adjustment-clean daily ADR series adjudicates the \$29.36 high, and an ADR-versus-local basis series is pulled on *synchronised* timestamps. Until then every price-based band below is provisional, because the screen that produced this name is invalid.

Reopen Gate B — a measured divergence (blocking, non-price). No entry until a street Q2 FY27 revenue/EPS point-and-range exists. Without it we cannot state what we disagree with.

Reopen Gate C — the quality print (blocking, event). At the Q2 FY27 print, require **USD revenue > \$5.25bn** (breaking the ~\$5.08bn plateau) **and operating margin ≥ 21.1% with USD/INR flat-to-stronger (≤ 94.5 on the quarter average)**. This is the only condition that converts the margin finding from bear to neutral.

If A, B and C all clear: - Starter: 0.75% of book, paid up to \$11.50 (≈ 15.5x trailing EPS). Above \$11.53 the multiple exceeds what a 1.5–3.0% grower supports — **no entry at any size above \$11.55.** - **Add: +0.75% (to 1.50%)** only on a *second consecutive* quarter of margin ≥ 21.1% without a currency subsidy. - **Hard cap: 2.00% of book.** Fill limit 10% of trailing 20-day volume per day.

If A and B clear but C fails (margin quality confirmed deteriorating): - Deep-value band only: \$8.92 (12x) scaling to \$8.18 (11x) — i.e. 19–25% below spot. This is the “damage is in the price” band, starter 0.50%, cap 1.00%. Rationale: 200–370bp of ex-currency erosion on a mid-teens multiple is roughly a 2–3 turn de-rating. - Basis note: at spot rupee (~₹94.9) the local close implies **~\$11.95** per ADS, so today's \$10.96 is an ~8% discount to local-implied — but the P/E rails agree within 0–5%. That conflict is a timestamp artifact (31-Aug local close versus 11-Sep ADR tape), **not a buyable gap**. Do not underwrite any part of an entry on basis convergence.

No-touch conditions (re-underwrite from scratch): FY27 guide trimmed to the $\leq 1.5\%$ CC rail; margin below 20.5% on a currency-neutral basis; any depositary ratio, fee, or fungibility change; any change in dividend/buyback withholding treatment.

Catalyst dates: | Date | What | Confirmed | |—|—|—| | 2026-10-14 → 2026-10-23 | Q2 FY27 results (window; yfinance says 10-23, prior year printed 10-16) | **No** | | 2027-04-01 | CEO handoff (Dash) — incoming CEOs reset margin/growth bands; asymmetric risk into FY28, priced by neither bench | **No** | | ~Semi-annual | Interim dividend record/pay dates under the 85%-cumulative policy | **No** |

ARMED SENSORS

(armed provisionally with this deck; session adjudication ratifies)

- price alert: fires below 10.75 (deck-provisional: flags a $>10\%$ discount to local-implied $\sim \$11.95$ at spot INR - plumbing/arb check only, explicitly NOT a)
- filing watch: 6-K until 2027-03-10 (deck-provisional: Q2 FY27 results and the earnings-date intimation that would finally confirm the unconfirmed print date)
- dated pack INFY2026-10-16: INFY: modal Q2 FY27 print date on prior-year base rate (2025-10-16) (date confirmed=False)
- dated pack INFY2026-10-23: INFY: yfinance-derived Q2 FY27 print date - no company document names it (date confirmed=False)
- dated pack INFY2026-12-18: INFY: only tax-compliant option expiry if a chain read ever reopens the options route - captures the October fork inside the 2026 harvest ye
- dated pack INFY2027-04-01: INFY: CEO handoff (Dash) - incoming-CEO guide reset is asymmetric risk into FY28, priced by neither bench (date confirmed=False)

What remains unverified

Every item below is genuinely open; anything already resolved or estimated-and-disposed sits in the table above. Each carries an estimate where it cannot be drained now.

1. **Whether the \$29.36 52-week high is adjustment-clean.** Blue's kill is arithmetic and secondary-sourced; an exchange-grade adjusted daily series has not been pulled. *Estimate: true $dd52$ -38% to -45% (point -41%), $p(\text{rail is contaminated}) = 0.85$.*
2. **Street Q2 FY27 consensus revenue and EPS, point and range.** *Estimate: revenue $\$5.10$ – $5.20bn$, EPS $\$0.19$ – 0.20 , derived from the 1.5 – 3.0% CC guide plus normal seasonality; $p(\text{actual lands in range}) = 0.6$.*
3. **FY27 currency sensitivity (bp of margin per 1% rupee move).** Not disclosed. *Estimate: 20 – $30bp$ per 1% , from the company's own historical $\sim 1.2pp/4.9\%$ disclosure; $p = 0.65$.*
4. **The Q2 FY27 print date.** No company document names it. *Estimate: $2026-10-14$ to $2026-10-23$, modal $2026-10-15/16$ on the prior-year base rate; $p(\text{window}) = 0.8$.*
5. **The true ADR-vs-local basis on synchronised timestamps** (the -9.4% vs 0 -to- -5% conflict). *Estimate: -2% to -8% , midpoint -5% ; $p = 0.6$.*

6. **Share count / market cap reconciliation** (~3.87bn implied vs ~4.1bn outstanding). Drainable now from the 20-F cover / XBRL.
7. **Whether a listed options chain exists, and its chain-level midpoint IV versus realised vol.** *Estimate: 28–34% annualised implied on comparable large-cap Indian IT ADRs; $p = 0.5$.*
8. **ADR average daily volume** (needed for any size/impact statement). *Estimate: 6–12m shares/day, ~\$70–130m notional, from large-cap ADR base rates; $p = 0.6$.*
9. **Top-10 client concentration** from the 20-F client-data exhibit. Drainable now from the 2026-06-15 20-F.
10. **Q3 furlough/seasonality comp shape** — required before any deceleration verdict. *Estimate: Q3 qoq -0.5% to $+1.0\%$ from prior-year furlough patterns; $p = 0.6$.*

PRIZE TABLE + VOL READ

Required here because items 1–5 are genuinely time-gated (the October print) or private (the sensitivity disclosure and the street's number). Anchored per anchor-and-adjust: **anchor = spot \$10.96**; the local-implied \$11.95 is noted as a secondary anchor but deliberately not used, because the basis itself is unverified (item 5).

Scenario	What it looks like	Price	Prob
Rail clean + FX-unsubsidised beat	Q2 USD revenue > \$5.25bn, margin $\geq 21.1\%$ with rupee flat-to-stronger; guide held to upper half; re-rate to ~17x	\$13.20	0.20
Plateau holds	In-line quarter, ~\$5.1bn, margin ~21%, 14.7x sustained, rupee drifts a few percent weaker	\$10.50	0.40
Ex-FX erosion surfaces	Rupee stabilises, the 200–370bp of underlying erosion becomes visible, margin prints 19.5–20.3%, multiple to ~13x	\$8.60	0.28
Low rail + pricing deflation	Guide cut toward 0–1.5% CC, margin <19.5%, multiple to ~11x	\$7.00	0.12

EV = \$10.09 versus spot \$10.96 = **−8.0%**. The prize table independently reproduces the courts' verdict: this is a negative-expected-value long at today's price. It turns positive at roughly **\$9.15 and below**, which is why the deep-value reopen band sits at \$8.18–8.92 and not at spot.

$\sigma_{\text{table}} = \$1.94 = 17.7\%$ of spot over the ~3-month horizon to a December expiry ($T = 0.268y$) $\Rightarrow$ **annualised $\sigma_{\text{table}} \approx 34\%$** . The table is **mildly bimodal and fork-dated**: essentially all of the dispersion resolves in a single window (the unconfirmed 2026-10-14→10-23 print), with the upper mode requiring *two* independent conditions (revenue break **and** currency-neutral margin) versus one for the lower modes — which is why the downside carries 0.40 of probability mass and the upside 0.20.

Expression math, priced off the table itself:

Strike (Dec-2026)	$C_{ours} = \sum p_i \cdot \max(S_i - K, 0)$	Chain mid	Verdict
C \$11	\$0.44	not retrieved	cannot adjudicate
C \$12.5	\$0.14	not retrieved	cannot adjudicate
P \$10	\$0.75	not retrieved	cannot adjudicate
P \$9	\$0.35	not retrieved	cannot adjudicate

IV-vs-RV: UNAVAILABLE. IV percentile: UNAVAILABLE. VRP (IV – RV): UNCOMPUTABLE.

Neither bench could reach the option chain or a daily bar series, so no realised vol and no chain-level midpoint IV exist. We will **not** substitute an underlying aggregate IV feed for chain-level midpoint IV — that is exactly the TSSI lesson, where the aggregate feed read 71 against a chain that was actually 101, a 30-point error large enough to invert a cheap/rich call. Using it here would flip the recommendation below on a number we know to be unreliable.

The decision the arithmetic produces (shown, not asserted): our table says annualised dispersion $\approx 34\%$. *If* chain-level midpoint IV prints materially below $\sim 34\%$ (say $\leq 28\%$), the fork is cheap relative to our own dispersion and the gated add could be expressed in the **December \$11 call at or under \$0.44**. *If* chain IV prints above $\sim 34\%$ (say $\geq 40\%$), the fork is rich, we are sellers not buyers, and the route is the premium-selling gate — a **cash-secured put at \$9**, which we value at \$0.35 and would only write for meaningfully more, at a strike that is inside our own deep-value entry band so assignment is an outcome we want. We cannot determine which branch applies, because we have no quotes. **Therefore: instrument recommendation = NONE. No stock, no calls, no covered calls, no cash-secured puts.**

Tax overlay. This is a harvest year, so the loss branch must land in **2026**. Any structure expiring on or after 2027-01-01 defers the loss into the following tax year and is **excluded** unless the edge numerically dominates — it does not here, with EV at -8% . Usefully, the fork resolves in mid-to-late October, so a **December-2026 expiry captures the entire catalyst inside the harvest year** and is the only tax-compliant option tenor if and when a chain read reopens this. A January-2027 expiry (annualised $\sigma_{table} 30\%$ on $T = 0.345y$) is **excluded on tax grounds alone**, independent of pricing. Stock bought now would also have its loss branch available in 2026 — but EV is negative, so that is moot.

Primary source cited throughout: the prior-year Q2 press release exhibit, which fixes both the \$5,076m / 21.0% comparison base and the 2025-10-16 print-date base rate —

ADJUDICATION — 2026-09-16 15:36Z

~11% INR slide implies +250–400bp gross tailwind vs +30bp realised = 200–370bp underlying erosion (NOVEL). Dislocation input was a corrupt hi52 rail.

REOPEN GATES: adjustment-clean ADR series adjudicates the \$29.36 high; Q2 FY27 margin $\geq 21.1\%$ with INR flat-to-stronger; street anchor; company-fixed date

PROCESS: hi52 rail corrupt on the ADR — pack-builder defect
