

# IREN pitch deck

## PITCH — IREN — VERDICT

**ADJUDICATED 2026-08-16 — HOLD the existing half-starter (116 shares @ \$44.41 cost, ~\$4,308 at the \$37.14 tape, unrealized -\$843); NO ADD and NO EXIT: two of the three 8/27 gates passed, the funding gate did not, and on the company's own fully-delivered numbers the fair value lands at roughly today's price.**

*Housekeeping note before anything else: the adjudication is dated 2026-08-16, which is eleven days **before** the FY26 print. Both benches below are post-print and carry facts the adjudicator did not have (the \$25–30bn capex guide above all). The 8/16 ruling's **disposition** still governs — nothing licenses more than a half position until the three gates pass — but several of its **numbers** are superseded, and I flag each one rather than quietly restating it.*

---

### What we believe

---

IREN builds and rents out data-center capacity for AI computing. It is walking away from bitcoin mining — which was essentially all of its profit — and replacing it with long-term contracts to rent GPU capacity to large customers, Microsoft among them.

Three things we believe, in order of how much weight they carry:

- 1. The delivery story is real, not promotional.** The bear narrative going into the print was that the contracts were vapor. They are not. Customer prepayments actually landed in the bank: deferred revenue went from \$0.9M to \$120.4M, and signed contracts total \$2.8bn. The first site was accepted by the customer and started producing revenue — the AI cloud segment more than doubled quarter-over-quarter, from \$33.6M to \$70.5M. The definition of the headline “annual recurring revenue” figure was *not* quietly loosened at the print, which was the specific thing we were watching for.
- 2. But the prize, valued honestly, is roughly the price we are paying.** If you take the company's own target — \$4bn of contracted annualized revenue, fully delivered — and value it at margins comparable to its closest public peer, you get something between “today's price” and “modestly above today's price,” depending entirely on how you charge for the cost of replacing GPUs and for the shares that will be issued to pay for it all. The two benches landed at \$37/share and \$50/share respectively from the *same* revenue assumption. The whole gap between them is the capital charge.
- 3. The upside that would make this interesting is not funded, not contracted, and structurally capped.** Everything above ~\$50 requires the 2027 expansion (roughly 1.2 gigawatts) to be built and rented, and that expansion is neither under contract nor paid for. Meanwhile the shares needed to pay for it are already promised: \$2.3bn of convertible bonds

convert at \$51.40 (15% above the tape) and NVIDIA holds warrants for 30M shares at \$70. The two places the stock would have to reach are the two places new supply arrives.

**So: we hold a small position because the company is doing what it said, and we do not add because we would be paying full price for a result that requires a second, unfunded miracle.**

Separately and honestly: on 8/16 the principal elected to run this as a named, graded **event bet** — a large short base (22–32% of the tradable shares) sitting on a story already disproven, meeting a confirmed catalyst. That bet has now been graded. See the table below. It half-won.

## What the market believes

---

The market believes two contradictory things at once, which is why the stock fell 8% after hours on good delivery news.

- **Seventeen analysts, average price target ~\$80, mostly “Buy.”** They believe the ramp happens: consensus revenue for the fiscal year ending June 2027 is roughly \$2.99bn against \$707M actually earned in the year just reported. That is a 4x jump in four quarters, and about 10x on the AI segment specifically.
- **Somewhere between 22% and 32% of the tradable shares are sold short** (about 93.7M shares). That side believes the funding does not clear, the shareholders get diluted into oblivion, or both.

The *revealed* belief — what the tape actually did on 8/27 — is the interesting one. The company reaffirmed \$4bn of contracted revenue, dated its next three sites, and announced a new frontier-lab customer. All bullish. The stock closed \$40.53 (+2.4%), then fell 8.2% after hours to ~\$37.19 once the slides were read. What moved it was not the profit-and-loss statement. It was the capital plan: **\$25–30bn of spending guided for the coming year, against a company worth about \$14.5bn.**

The market’s real position is therefore: *we believe the demand, we do not know who pays for it, and every new contract makes that question bigger, not smaller.* That is a coherent and, in our view, correct reading.

## Why we might have edge

---

Four candidates, ranked by how much I actually believe them.

1. **We read the primary documents and the loudest bear claim is simply false.** The “contracts are fake / revenue isn’t landing” story is refuted by prepayment cash in the balance sheet and by an audited doubling of segment revenue. A large short base is positioned on a thesis that the filings have already disproven. That is a genuine information advantage over the marginal seller — *but see the grading table; it did not pay this time.*

2. **We caught our own arithmetic before it cost us.** Our first pass killed this on a valuation table built with stale cash, and the correction was worth about \$3.7bn of enterprise value — the difference between “no upside at all” and “+36%.” Being able to overturn our own kill is the edge; see the self-check table.
3. **We are watching the right variable.** Both benches converged, independently, on the same binding constraint: share count, not revenue. Shares outstanding went from 283.5M to 394.1M in nine months. Nobody’s price target is expressed per-share-adjusted for that. If we track the denominator on every filing cover, we will know before consensus does whether the upside accrues to us or to the next tranche of buyers.
4. **Weak / honest caveat:** the “we can see the buildout from space” edge does not exist here. Our satellite check returned nothing usable — the coordinates were town centroids rather than the actual parcels, and the most recent usable images are eight to nine months old. We have **no independent ground truth** on construction. The entire delivery schedule rests on company press releases. That is the opposite of edge and I am not going to dress it up.

## Why it might be priced in

---

Bluntly: mostly, it is.

- **The prize table lands at the tape.** Charge the business for replacing GPUs on a five-year life, for interest on \$7.6bn of debt, and for the shares that will be issued to fund the plan, and \$4bn of delivered revenue at ~65% margins is worth about today’s price. The valuation only clears +50% above roughly 67–68% margins with zero slippage, full delivery, and only modest dilution.
- **Seventeen analysts cover it and the average target is more than double the price.** This is not an undiscovered name. It is a crowded battleground with heavy positioning on both sides. Crowding does not tell us direction, but it does tell us we are not early.
- **We agree with the bulls about the trajectory.** Our disagreement is entirely about financing friction — which is exactly the thing the short base is already paid to worry about. When our disagreement with consensus is the same disagreement the shorts already hold, we are not contributing an independent view.
- **The good news that would re-rate it has already printed** and was met with an 8% decline.

## What could go wrong

---

*(the pre-mortem)*

**Failure narrative 1 — “The prize was real and it went to the new shareholders.” (Most likely. Monitorable.)** The 2027 expansion gets built and rented, revenue hits \$4bn and then \$10bn, and the stock still does nothing, because paying for \$25–30bn of construction against a \$14.5bn company required issuing 40–60% more shares. We are right about the business and wrong about our claim on it. This is the single most probable way we lose. Documented behavior supports it: share count is up 32–39% in nine months (the two sources disagree — see unverified), and the company has visibly

issued into strength. **Tripwire: shares-outstanding on every filing cover, plus any prospectus supplement (424B5/424B7).** Both are cheap and both currently exist only partially — see missing sensors.

**Failure narrative 2 — “The AI capital-spending regime broke and took the whole complex with it.” (Second most likely. Weakly monitorable.)** A hyperscaler signals a digestion pause, the entire rent-a-GPU complex re-rates, and IREN — which is a leveraged, unfunded expression of that single factor — falls 50% on news that has nothing to do with IREN. We would be right about the company and lose anyway. The tripwire here is weak: we would see peer tape, but by the time the tape confirms it, the move has happened. This is beta, not analysis, and our position is a pure expression of it.

**Failure narrative 3 — “The contracts were repriced or the customer stepped back, and we found out last.” (NO MONITORABLE TRIPWIRE.)** The \$4bn figure is a private construct: contracted price per megawatt multiplied by 8,760 hours a year, i.e. a 100%-utilization assumption, against \$70.5M of revenue actually recognized last quarter. Contracts get renegotiated. Utilization assumptions get missed. A counterparty gets into trouble. **None of that generates a filing obligation until it is already material**, we have no independent channel into it, and the party certifying the technical quality of the platform — NVIDIA, whose “Exemplar Cloud” designation is cited as validation — holds 30M warrants on the stock it is validating. That is an interested certifier, not an audit.

I am naming the unknown-unknown class explicitly: **off-tape commercial-terms risk inside a private contract stack we have no independent channel into, compounded by interested-party validation.** We would learn about this from a press release, on the same day as everyone else, at whatever price the tape gives. There is no sensor I can build for it. The nearest partial mitigations — a working satellite/thermal read on whether the sites are actually energized, and a permit feed for the counties involved — are exactly the two channels we currently do not have.

**The reflexive and structural leg.** Our own trading is not the problem: 116 shares against a stock where 93.7M shares are held short is not even a rounding error on daily volume. We have no market impact and no exit-liquidity risk. The reflexivity runs the other way, and it is worse:

- **A rally is partly self-defeating for us.** This company funds itself by issuing equity into strength. Our upside case is the mechanism that creates the supply that caps it. We would be bidding into flow we ourselves predict — the one thing our own doctrine tells us never to do.
- **The two upside destinations are both supply walls.** \$51.40 is where \$2.3bn of converts turn into shares. \$70 is where NVIDIA’s 30M warrants strike. Those are not resistance levels drawn on a chart; they are contractual share-creation events sitting on the path.
- **Doctrine interaction — the correlation waiver.** The household book already carries substantial AI exposure. The rule that would have sized this position down for that overlap was **waived for IREN specifically** by the principal on 8/16. That waiver is a deliberate, eyes-open decision, but its consequence is real: in failure narrative 2, this position and the rest of the book

fall together, and the mechanism that would have sized for that was switched off. The waiver applies to this name only; the overlay stands everywhere else.

- **Doctrine interaction — do not sell calls against this.** High short interest plus an unresolved catalyst is precisely the setup where the stock runs straight through a covered-call strike. Any “collect premium while we wait” idea here is a bad idea, and I am pre-registering that so nobody proposes it in November.
- **Doctrine interaction — reason drift.** This position was re-labeled on 8/16 from a fundamental starter into an **event bet**. That event has now resolved (mostly against us). If we keep holding, we must be honest that we are holding it as a fundamental position that the fundamental work values at roughly the tape — not as an event bet, because the event is over.

**If this position loses money, the most likely reason will be** that we were right about the business and wrong about our share of it — the company delivers the \$4bn, then funds the next \$25–30bn by issuing 40%+ more stock into every rally, so the prize arrives on schedule and accrues to the shares issued to pay for it rather than to the ones we own.

## What we checked ourselves

| Claim                                                                                                     | How checked                                                                  | Found                                                                                                                                                                                                                            | Confirmed?                                                   |
|-----------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------|
| “The contracts are vapor; no revenue is landing”                                                          | FY26 8-K and 10-K, filed 8/27 ( <a href="#">8-K</a> , <a href="#">10-K</a> ) | Deferred revenue \$0.9M → \$120.4M (customer cash actually received); \$2.8bn signed contracts; AI segment revenue \$33.6M → \$70.5M                                                                                             | <b>REFUTED — the bear story is dead on primaries</b>         |
| Headline revenue metric was quietly redefined at the print                                                | Read the FY26 release definition verbatim against the prior one              | Unchanged: contracted price per MW × 8,760 hours. The definition held                                                                                                                                                            | <b>CONFIRMED unchanged (this was gate 1 and it passed)</b>   |
| <b>OUR ERROR #1</b> — “Annualized revenue doubled in eight weeks,” used as a kill                         | Traced the citation back to source                                           | Citation artifact. The actual sequence was \$3.7bn → \$4bn, i.e. +8%, <b>not +100%</b> . Our own bench manufactured a fraud signal out of a misread                                                                              | <b>OUR BENCH WAS WRONG</b>                                   |
| <b>OUR ERROR #2</b> — valuation table built on \$2.2bn of cash                                            | Pulled June 30 balance sheet                                                 | Actual cash \$5,895.6M, debt \$7,593.0M → net debt \$1.70bn, not \$5.1bn. A <b>\$3.7bn</b> enterprise-value error that turned +36% into ~0%                                                                                      | <b>OUR BENCH WAS WRONG (caught and corrected internally)</b> |
| <b>OUR ERROR #3</b> — both benches carried a 3.31% financing cost                                         | FY26 release, Microsoft GPU financing terms                                  | Actual coupon <b>6.0%</b> . 3.31% was a credit spread, not a rate. ~\$455M/yr of interest on \$7.59bn                                                                                                                            | <b>OUR BENCH WAS WRONG</b>                                   |
| <b>OUR ERROR #4</b> — the review that overturned the kill said “the other bench got the arithmetic wrong” | Compared the two benches’ stated enterprise values line by line              | They agree within 1%: <b>\$16.19bn vs \$16.35bn</b> , the difference being the share price used. The “\$21.1bn” figure attacked was from an <i>earlier, pre-print</i> draft. The rebuttal’s headline overstated the disagreement | <b>OUR REBUTTAL WAS PARTLY MISDIRECTED</b>                   |
| <b>OUR ERROR #5</b> — “a revenue miss on 8/27 would be a low-information event”                           | The tape on 8/27–8/28                                                        | Refuted. Revenue missed (\$137.2M vs \$157.1M consensus) and the stock fell 17% from our cost. The items we designated <i>high</i> -information printed bullish while the stock dropped. We had                                  | <b>OUR BENCH WAS WRONG</b>                                   |

| Claim                                                                              | How checked                                                                                         | Found                                                                                                                                                                                                                                                          | Confirmed?                                                             |
|------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------|
|                                                                                    |                                                                                                     | the information hierarchy backwards;<br>the capital plan was the news                                                                                                                                                                                          |                                                                        |
| <b>OUR ERROR #6</b> — residual funding gap is “~\$3.5bn”                           | Q4 FY26 call, management verbatim                                                                   | FY27 capital spending guided at <b>\$25–30bn</b> , of which ~\$14bn is cash-plus-committed, ~\$8bn is “to be secured,” and \$3–8bn has <b>no named source</b> . We were off by roughly 8x on the single most important number                                  | <b>OUR BENCH WAS WRONG — and this is now the binding constraint</b>    |
| Enterprise value and share count                                                   | 10-K cover page                                                                                     | 394,058,648 Class A shares (8/14/26) + 2 Class B. Market cap ~\$14.5bn, EV ~\$16.2–16.35bn. <b>The 8/16 adjudication’s “~\$22.obn EV” is pre-print and superseded</b>                                                                                          | <b>CONFIRMED — supersedes the adjudication’s own figure</b>            |
| Share count is compounding                                                         | Cover-page share counts across four filings                                                         | 283.5M (Oct-25) → 332.3M (Jan-26) → 357.4M (Apr-26) → 394.1M (Aug-26). Roughly +13% per quarter                                                                                                                                                                | <b>CONFIRMED (though see unverified: +39% vs +32% source conflict)</b> |
| Profitability is scaling with revenue                                              | FY26 8-K, quarter over quarter                                                                      | The opposite. Adjusted EBITDA fell \$59.5M → \$19.2M on a \$7.6M revenue decline. Full-year net loss \$(702.6)M, Q4 alone \$(684.0)M                                                                                                                           | <b>CONFIRMED — unfavorable</b>                                         |
| Mining exit is a pivot                                                             | 10-K / call                                                                                         | It is a subtraction first. Mining is “effectively decommissioned by end of December 2026,” removing \$578.2M of revenue and essentially all \$245.7M of adjusted profit. September and December are bridge quarters                                            | <b>CONFIRMED</b>                                                       |
| Impairment is a red flag                                                           | FY26 8-K                                                                                            | \$638.8M full-year / \$450.4M in Q4, plus \$102.1M held-for-sale. Non-cash and specific to the mining exit. Not a kill, but the mining fleet’s resale value — an implicit cash buffer — is now written off                                                     | <b>CONFIRMED, not fatal</b>                                            |
| Company disclosed one capacity number to investors and a different one on the call | Compared slide (“0.3GW 2026 / 0.8GW 2027”) against call (“1.2 gigawatts in 2027 of gross capacity”) | They reconcile. No inconsistency across venues. <b>Recording this as a positive finding: we looked for selective disclosure and did not find it</b>                                                                                                            | <b>CONFIRMED CLEAN</b>                                                 |
| Can we verify the buildout physically?                                             | Satellite connector, two sites                                                                      | <b>No</b> . Coordinates were county/town centroids, not the parcels; most recent images 8–9 months old. Thermal check never run. No permit coverage for Childress or Nolan County, TX, or the British Columbia sites                                           | <b>UNCHECKABLE — a coverage gap, not a finding</b>                     |
| Was this name properly sourced?                                                    | Funnel trace                                                                                        | It entered through a sector screen that <b>mis-classified IREN as a financial company</b> . Nine of fourteen matched detectors were noise from that mistag (bank call reports, consumer app reviews, clinical trials). The right detectors were largely absent | <b>PROCESS FAILURE — noted</b>                                         |

| Claim                        | How checked                    | Found                                                                                                                                                                                                                                                                                                                      | Confirmed?                                                           |
|------------------------------|--------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------|
| <b>The event bet, graded</b> | 8/26 close (~\$39.58) vs today | Gate leg: <b>WON</b> — 2 of 3 gates passed including unchanged definition (we said 60%). Upside leg: <b>LOST</b> — we said 50% for $\geq +10\%$ within three sessions; actual is about <b>-6%</b> . Downside leg: also did not trigger ( $-10\%$ not reached). The outcome landed in the ~25% residual neither-tail bucket | <b>HALF-WON.</b><br><b>Provisional — today's close is not in yet</b> |

## PROPOSED ENTRY BANDS

**No new entry is authorized. The half position stands; tranche 2 is not unlocked.** The gates below are reproduced verbatim from the ruling, each followed by where it actually stands.

**- 8/27 print (CONFIRMED) TRANCHE-2 GATES, all three: ARR  $\geq$  \$4bn on UNCHANGED 8,760-hr definition; Horizon 2 DATED; H2 capex funding named WITHOUT common issuance**

- Gate 1 — **PASSED**. \$4bn contracted, definition verbatim unchanged.
- Gate 2 — **PASSED**. Sites 2–4 dated “targeting delivery in Q4 2026.”
- Gate 3 — **FAILED**. Funding was named only as “existing cash, GPU financing, prepayments, data center financing... and corporate sources.” “Corporate sources” is not “without common issuance,” and \$3–8bn has no source at all. A resale prospectus for 11.98M shares was filed 8/4.
- **Result: 2 of 3. The ruling requires all three. Tranche 2 does not fire.**

**- KILL-to-flat: ARR/contracted-% cut, or Horizon 2 slip**

- **NOT TRIGGERED**. Revenue target was reaffirmed, not cut; site 2 was dated, not slipped. **We therefore do not sell**. The position is held, not liquidated.

**- add zone: ledger alert 38.70 (pre-Microsoft-announcement level) if gates passed but tape gives it back**

- **Level already breached — and deliberately not acted on**. The stock is \$37.14, below \$38.70. The condition on this alert is “*if gates passed*,” and gate 3 did not. The alert stays armed as a monitor; **it does not authorize a purchase**. This distinction is the whole discipline of the ruling and I am flagging it because the level looks actionable and is not.

**- fresh Sentinel-2 scene of Sweetwater earthworks = the physical-verification gap closing (re-run the connector with corrected parcel coords)**

- **OPEN — and this is the highest-value unfinished work on the name**. Re-run with actual parcel polygons rather than town centroids, and add a thermal read over the Childress site to test whether it is genuinely drawing power at the claimed 50MW. Until that is done we have no independent confirmation of anything physical.

**Sizing.** Hold 116 shares. No add before the next print. The ruling's cap — nothing beyond a half position pre-print — remains in force because the event that would have lifted it did not fully clear.

**What would unlock tranche 2 at the next print** (four tests; **any two failing = sell the position at whatever the tape gives**): 1. Share count grows less than 5% quarter-over-quarter; 2. Operating annualized revenue  $\geq$  \$2bn, definition still unchanged; 3. Sites 2–4 actually delivered against the Q4-2026 guide; 4. FY27 funding named with the common-equity portion explicitly bounded.

**What would make this a genuine buy rather than a hold:** a signed, non-recourse, project-level facility covering  $\geq$  \$8bn of the gap at investment-grade pricing, serviced from the project's own revenue — announced in an 8-K, not mentioned on a call. That single event moves this from “priced at fair” to “cheap,” because it removes the dilution channel that caps the upside.

**Catalyst dates.** Monthly operations update — the company publishes these; the next is due within days (date not confirmed). Q1 FY27 print — **2026-11-05, unconfirmed** (derived from a data vendor; no company release names it, so treat the date as soft). Sites 2–4 delivery target — Q4 2026. Mining fully decommissioned — end of December 2026.

**Tax note.** The lot is 116 shares at \$44.4086, currently about \$843 underwater and short-term. Harvesting it is economically trivial and I am not recommending it — but if anyone wants the loss, it must be sold **before roughly October 5**, because a later sale would put the 30-day repurchase restriction directly on top of the November 5 decision date and block us from acting on our own gates.

## ARMED SENSORS

---

(armed provisionally with this deck; session adjudication ratifies)

- price alert: fires below 38.7 (deck-provisional: pre-Microsoft-announcement level; MONITOR ONLY - add is conditional on all three 08-27 gates passing a)
- filing watch: 8-K until 2027-02-28 (deck-provisional: a signed non-recourse project-level facility covering  $\geq$  \$8bn of the FY27 gap at investment-grade price)
- dated pack IREN|2026-08-27: IREN FY26 print 8/27 (CONFIRMED by PR): TRANCHE-2 THREE-GATE, all must pass: (1) ARR  $\geq$  \$4bn on the UNCHANGED 8,760-hr definition (watch for
- dated pack IREN-STK|2026-09-01: GRADE stale\_short\_thesis\_squeeze test #1: IREN close 9/01 (T+3) vs 8/26 pre-print close. Frozen: 0.60 gates / 0.50  $\geq$  +10% / 0.25  $\leq$  -10%. Cap
- dated pack IREN|2026-09-08: IREN: monthly operations update - company publishes monthly; exact date ESTIMATED, not confirmed (date confirmed=False)
- dated pack IREN|2026-11-05: IREN: Q1 FY27 print - four-gate tranche-2 decision (share count  $<$  5% QoQ, operating ARR  $\geq$  \$2bn on unchanged definition, sites 2-4 delivered,
- dated pack IREN|2026-12-31: IREN: issuer target for delivery of Horizons 2-4 and for mining being effectively decommissioned - both are company targets, not confirmed e

- dated pack IREN|2027-02-11: IREN: expiry of the standing 8-K filing watch on this name (date confirmed=False)

## What remains unverified

---

- **The FY27 funding mix — debt versus equity.** This is the single variable that decides whether the upside accrues to us. It is genuinely unknowable until the company executes it, and it will likely be announced fully-formed.
- **The share-count growth figure itself.** One source says +39% over nine months (283.5M → 394.1M), the ruling says +32%. Both cannot be right. Compounding this: **the automated financial-data block in our own evidence pack came back completely empty** — revenue, stock compensation, diluted shares and operating cash flow all blank. That means none of the per-share arithmetic in this deck was machine-verified against audited data; it was hand-built from filings and press releases. Treat that as an infrastructure failure, not a clean bill of health.
- **Convertible bond terms.** Never fully pulled. The \$51.40 conversion price and \$2.3bn size are carried from the ruling and have not been read from the indenture.
- **AI-segment gross margin, and the depreciation life used for GPUs.** Not disclosed. The entire valuation gap between “worth \$37” and “worth \$50” is this number. We are guessing.
- **Anything physical.** No usable satellite imagery, no thermal read, no permit data. The delivery schedule is company-attested only.
- **Customer acceptance.** Confirmed by the company, not by the customer. There is no Microsoft statement. The technical validation that is cited comes from a party holding 30M warrants on the stock.
- **The November 5 print date.** Vendor-derived. No company release names it.
- **Our own position size.** The order envelope describes this as roughly 0.5% of the book; one bench describes it as 0.03%. That is a 16x discrepancy in what we think we own relative to everything else, and it needs resolving against actual account balances before any tranche-2 decision — the sizing math in November depends on it.
- **Today’s grade is provisional.** The event-bet grading uses an intraday price captured at 2:04pm Eastern. The official grade needs tonight’s close, and ideally the post-print change in short interest.
