

PITCH — MMYT — VERDICT

ADJUDICATED 2026-09-16 — FLAT — put is 2028 not 2030 (conviction 7/10). The court found nothing to own at this price; the reopen gates below are the only path back.

What we believe

MakeMyTrip is India's largest online travel marketplace. Its *business* is fine and its *balance sheet* has a dated problem, and the stock at \$48 (pack tape, -53.5% off the 52-week high of \$103.24, +46.9% off the \$32.67 low) is pricing something between the two.

Three things we think are true:

1. **The demand engine is still running.** Constant-currency gross bookings grew ~19.9% and constant-currency revenue ~16.1% in the most recent reported quarter. Nothing either bench produced contradicts those filed numbers. That leg survived the whole adversarial process untouched.
2. **The reported earnings collapse is largely a financing artifact — but only *largely*, and only until July 2028.** The company issued \$1.4375B of 0.00% convertible notes labelled “due 2030.” The accounting charge for those notes is non-cash today. It becomes cash later, and “later” is nearer than the label suggests.
3. **The gap between the stock and the street is real but unexplained.** Street price target is ~\$75 against a \$48 tape — the stock sits 36% below the consensus anchor while consensus revenue for FY27 is unchanged at \$1.21B. Somebody is wrong; we cannot yet name the mechanism that closes it, and an unnamed mechanism is not a trade.

What we do **not** believe any more: the original brief's claim that the converts are “a 2030 cash claim.” That was refuted by the issuer's own closing press release. Holders can require the company to buy the notes back **for cash at 100% of par on July 3, 2028** ([BusinessWire, 2025-06-23](#)). At \$48 against a \$121.50 conversion price, that put gets exercised with near-certainty. The brief was wrong by two years, and we say so plainly.

What the market believes

The market believes two things at once, and they are not obviously compatible:

- **Sell-side:** revenue is fine, dollar earnings are impaired. FY27 revenue held at \$1.21B while FY27 EPS was cut from \$0.547 to \$0.487. Target ~\$75. That is precisely our own view of the units — so on the *facts* we agree with the street.

- **The tape:** -53.5% from the high, and — importantly — the market has already *seen* the good print. On the release the stock closed \$61.78, +8.5%; BofA raised its target to \$71 and Goldman reiterated Buy the next day. Then the tape round-tripped ~20% lower over the following weeks.

That last sequence is the most uncomfortable fact in this file. The bull evidence was published, was rewarded, and was then re-sold. “The market hasn’t seen the print” is not available to us as an argument.

At \$48 on ~94.06M shares the equity is ~\$4.52B; adding \$643M of net debt gives ~\$5.16B enterprise value, or **~98.6x** consensus FY27 IFRS EPS of \$0.487. That multiple only makes sense if you believe the IFRS earnings number is fake. After the 2028 put, it isn’t fake — it converts into real cash interest at refinancing.

Why we might have edge

Honestly: thinner than the original brief claimed.

- **The refi gap is arithmetically small, and most people are not doing the arithmetic.** The scary version is “\$1.4375B due vs \$794.3M of liquidity, coverage 0.55x.” The correct version adds seven quarters of cash generation before the put: ~\$182M/yr of operating cash flow ⇒ ~\$319M, plus ~\$45M/yr of deposit income ⇒ roughly **\$1.19B against \$1.4375B, a ~\$246M gap ≈ 17% of principal**. That is a refinancing to arrange, not a solvency wall. If the market is discounting the scary version, that is a gap we can trade — *once we can see the bond*.
- **The bond price is the single cheapest decisive datapoint and nobody has pulled it.** A 2030 note quoted near par says the market expects the cash put to be paid without drama. A note quoted in the 70s–80s says the opposite. Neither bench fetched it. That is a genuine, fixable information asymmetry — and it is cheap to fix, which is exactly why we should not pretend it is edge until we’ve fixed it.
- **One bench found a real capital-destruction fact the other missed:** 18.4M primary shares were sold at **\$90** in June 2025, alongside the converts, to fund the buy-in of Trip.com’s Class B stake (45.3% → ~17%). Stock retired near \$90 now trades at \$48 — roughly 45% impairment on ~\$3.1B of deployed capital, with a demonstrated ~17% seller still resident. That is a governance/capital-allocation read most screens will not surface.

Why it might be priced in

- **We agree with the street on the mechanism.** Volumes fine, dollar EPS impaired. When your differentiated insight is the consensus view, the burden shifts entirely onto “the tape is wrong,” which is the weakest form of a thesis.
- **The refuting evidence already traded.** +8.5% on the print, then -20%. Whatever the market learned, it learned it after being told the good news.
- **The put date is not secret.** Convertible desks model to the earliest holder put by construction. Assuming a \$1.4B refinancing wall is undiscovered by the people who own the paper is not a

defensible assumption.

- **98.6x on IFRS EPS is a screen output**, not an insight. Every value screen in the world already sees it.

We flag, symmetrically, that our own doctrine forbids rejecting a thesis solely because it is “priced in” or because we agree with consensus — and one bench leaned on both. Those rejections were correctly overturned. But overturning them does not manufacture edge; it just means the case has to be won on the funding evidence, which we do not have.

What could go wrong

Failure narrative 1 — The refinancing repricing (monitorable). The company refinances the 2028 put into straight or higher-coupon paper. Post-refi, roughly **\$90–100M/yr of what is today a non-cash accretion charge becomes actual cash interest** on a business generating ~\$182M of operating cash flow. That is over half of operating cash flow consumed by debt service, permanently. The stock doesn’t crash on the announcement; it just never re-rates, and the “IFRS EPS is optics” argument dies quietly. *Tripwires: 2030 bond quote, any 6-K announcing a facility or new issue, cash interest paid in the 20-F.*

Failure narrative 2 — Currency eats the story (monitorable). USDINR at ~94.5–95.4 versus ~87–88 a year ago is roughly an 8% year-over-year drag that *recurs* in the September quarter. Worse, the structure is amplifying, not offsetting: a **USD-denominated** cash put serviced by **depreciating INR** earnings. Constant-currency bookings can grow 19.9% forever and the reported dollar line still shrinks. Whether the notes are FX-hedged is unknown to both benches. *Tripwires: USDINR spot, the 20-F debt-note hedge disclosure.*

Failure narrative 3 — The private capital action (NO MONITORABLE TRIPWIRE). Trip.com still owns ~17%, has already demonstrated it will sell, and its intent is negotiated in private. So is any board decision to pre-fund the 2028 put with a discounted equity or equity-linked raise. Both would be decided in rooms we cannot see, and both are disclosed *after* the price is set — the 13D/A or the pricing PR arrives with the damage already done. There is no pre-signal, no alt-data proxy, no filing cadence to watch. **Unknown-unknown class: private counterparty intent / negotiated capital actions disclosed only post-execution.** A related sub-class sits alongside it: **Indian regulatory and channel structure** (GST treatment of OTAs, ONDC-style disintermediation, airline direct-booking pushes) — policy that arrives fully formed with no US-filing footprint we monitor. We have no sensor for either. We are naming this rather than inventing a tripwire we don’t have.

The reflexive / structural leg. Estimated 20-day ADV is roughly **1.6–2.0M shares (~\$80–95M/day)** — an estimate, not a measured figure, because we did not pull the volume series. At the proposed starter size (⅓ unit, ~0.5% of book) our clip is on the order of **5–8% of one day’s volume**: exitable in a day on a normal tape, but the exit we care about is the bad one, where the reason we are selling is the same reason everyone else is. Two structural amplifiers stack against us on that day: a **~17% strategic holder with proven willingness to sell**, and **~5.93M shares**

(+6.3% dilution) that mechanically arrive from the legacy \$230M 0.00% notes due Feb 2028, which are **in the money** at a \$38.80 conversion price against a \$48 tape. Supply is not scarce here.

The doctrine interaction is the subtler risk. Our rules forbid “priced-in” and “we agree with consensus” as rejections — correctly, because those are lazy kills. But applied mechanically they push us to keep a dead thesis alive on procedure, and our gate list makes that worse: every gate (bond ≥ 92 , INR < 96 , take-rate flat) resolves *upward*, so we buy only after the news is good and the price is higher. We would be building a ratchet that systematically pays for confirmation. If the bond prints 94 and the stock is \$58 when we get there, the gap to the \$75 anchor is 29%, not 56%, and the position is a different, worse trade than the one written here.

If this position loses money, the most likely reason will be ____ that we treated a solvable ~\$246M refinancing gap as the whole question, and the refinancing got solved — on terms that permanently convert non-cash accretion into ~\$90–100M/yr of real cash interest against ~\$182M of operating cash flow, so the balance sheet stops being scary and the equity still doesn’t re-rate, while INR depreciation quietly erases the constant-currency growth we were paid to believe in.

What we checked ourselves

Claim	How checked	Found	Confirmed?
“Converts are a 2030 cash claim, non-dilutive, non-economic” (original brief)	Issuer closing PR + pricing PR	Holders may require repurchase for cash on 2028-07-03 at 100% of principal ; conversion \$121.50 vs \$48 tape	NO — REFUTED. Our own brief was wrong by two years.
Accretion pace of ~\$29.2M/qtr (~\$117M/yr) “proves” a 2028-keyed amortisation schedule (red bench)	Our own recompute of implied effective rate on \$1,437.5M par	\$117M/yr over 3.03yr implies ~9.8% effective; over 5yr to 2030 implies ~11.0%. Both are high for MMYT straight debt, so the \$28.3M net finance cost is clearly <i>mixed</i> (accretion + FX on USD debt + leases, net of ~6% income on \$794M) — but it does not discriminate 2028 from 2030	Partly. Red’s inference was unsound; blue’s rebuttal was right in direction but its quoted rates (11%/13%) are ~1–2 points too high. Both benches erred here; ours is the corrected math.
“Coverage 0.55x, net debt \$643M”	Closing PR + FY26 OCF (transcript, secondary)	Net debt \$643M confirmed . But liquidity/principal is the wrong ratio: add ~7 quarters of \$182M/yr OCF (~\$319M) + ~\$79M deposit income $\Rightarrow$ ~\$1.19B vs \$1.4375B = ~\$246M gap, ~17% of principal	Fact yes; “solvency wall” framing NO — downgraded to a sizing gate
“\$1.6625B vs \$1.4375B principal unreconciled — either figure worsens the case”	FY26/FY25 20-F debt notes	Two separate series: legacy \$230M 0.00% due Feb 15, 2028 at \$38.80 conversion + \$1,437.5M due 2030. At \$48 the legacy notes are in the money $\Rightarrow$ ~5.93M shares	NO — REVERSED against the bench that raised it. The reconciliation exists; the second series is dilution, not a second cash wall.

Claim	How checked	Found	Confirmed?
		(+6.3%), settled in stock, not cash	
Share count / ~100x multiple	20-F + 424B5	90,448,984 ordinary (incl. 1,686,012 treasury) + 5,295,690 Class B ⇒ ~94.06M net. Multiple is 98.6x , not “~100x” loosely asserted	Yes on substance — but one bench derived 94M circularly from mcap ÷ price, which is not a check. Method corrected.
“The market already voted: popped 8.5% to \$61.78, then re-sold 20%”	CNBC live quote page	Price path is not verifiable from a live quote page ; and a round-trip names no mechanism for the re-sell	NOT CONFIRMED — retained as timing colour only, not as a kill
“We agree with the street ⇒ no edge”	Consensus data	FY27 rev \$1.21B steady, EPS \$0.547→\$0.487, PT ~\$75 vs \$48 tape = +56% / stock 36% below anchor	Overturned as fatal. Agreeing on units while the tape sits 36% under the anchor is the gap, not the absence of one — but the mechanism to close it is still unnamed.
Basis decomposition: bookings 19.9% > cc rev 16.1% > AOP 8.6%	Release figures	Take-rate and cc-margin compression; bookings is a gross basis against a net P&L	Yes — sizing-relevant, sustained by both benches
App review cohort delta as demand evidence (MMT 2.42 vs 4.78; Goibibo 1.90 vs 4.64; redBus 3.33 vs 4.68)	Method audit	Artifact. Spot readings with no historical baseline (so “decaying velocity” is unassessable), comparing two different populations (grievance-driven text reviewers vs prompted in-app raters), appearing on all three unrelated apps with no cross-sectional control	NO — one of our benches graded this FIRED and used it to corroborate “volume bought with inducements.” That was our error, caught in-house.
Tape figures used by our own benches	Pack TAPE	Benches carried \$53.44 / \$51.48 / \$49.06 and “+63.6% / +50.2% off low.” Pack governs: \$48.00, dd52 -0.535, +46.9% off low	NO — both benches worked off stale marks. All arithmetic in this deck is re-based to \$48.00.
Print date 2026-10-27	Pack + filing list	yfinance-derived, UNCONFIRMED. Newest 6-K (2026-08-07) is the AGM notice. MMYT’s practice is a dated scheduling PR ~10 days prior (last year: fiscal Q2 before market open, Tue Oct 28) — absent. A secondary source’s “board meeting 11 Sep 2026” conflicts with the vetted 6-K; primary governs	NO — treated as unconfirmed throughout
AGM date	6-K EX-99.1 (2026-08-07), quoted in pack	Monday, September 28, 2026, 5:00pm IST, Gurugram; FY26 statements audited by KPMG Mauritius; IR docs at http://investors.makemytrip.com	Yes — primary, venue-matched. Contains no growth claim.

Claim	How checked	Found	Confirmed?
Ramp-and-dump archetype	Detector, 9 features	1–2 of 9. Seller was a <i>strategic</i> (Trip.com), not insider distribution. Archetype does not fire	NO — correctly stood down; only the capital-destruction feature is present
Satellite/thermal/permit detectors (plant_thermal, sentinel2_buildout, FEMA NRI, Albuquerque/Austin/Bozema n permits, carbon_mapper, expedition_inventory, beauty suite, UP-C/TRA)	Dispatched	All inapplicable or clean. Asset-light marketplace; redBus Bengaluru (12.9768, 77.5901) is leased serviced office, LST reads urban background; no US footprint, no Up-C/TRA (Mauritius holdco)	Checked, no signal — recorded so the absence is not mistaken for an omission

PROPOSED ENTRY BANDS

Both benches ended FLAT. There is no immediate entry. What follows are the reopen bands.

No-entry rationale: the financing leg of the original thesis is dead as written, the demand leg is intact but already published and re-sold, and the one decisive datapoint (the 2030 bond quote) has not been fetched. Buying before that pull is paying for a guess we could simply look up.

Reopen — starter tranche ($\frac{1}{3}$ unit, ~0.5% of book, hard sleeve cap 1.5%). ALL THREE must be true simultaneously: 1. **2030 note quote ≥ 92** (chain-level / dealer mid, not a matrix price), **OR** the FY26 20-F debt note discloses a committed refinancing facility or capped calls that neutralise the July-2028 put. 2. **USDINR < 96 .** 3. **September-quarter take-rate flat or better** versus prior quarter — cc revenue growing at least in line with cc bookings — **and** AOP growing at least with cc revenue. Flat take-rate is the test, not merely “bookings $\geq 15\%$.”

Reopen price bands, given the gates pass: - **Starter zone: \$44–50.** $\frac{1}{3}$ unit. Below \$44 with gates *passing* is better, not worse — but only if the bond quote is being refreshed, not stale. - **Add #1: \$38–42** on a market-wide or India-macro drawdown with the bond still ≥ 90 — second $\frac{1}{3}$ unit. This is a “price fell, evidence didn’t” add only. - **Add #2: post-print, above \$58 on confirmed flat take-rate + a named refi** — final $\frac{1}{3}$. Deliberately a *higher* price: we pay up for the resolved unknown rather than pre-position for it. See the ratchet warning in the pre-mortem — this add is the expensive one and should be sized smallest if the first two filled. - **Hard no-entry / thesis void: 2030 note quote < 85 , or USDINR > 98 , or a dilutive equity-linked raise announced.** Below **\$32.67** (52-week low) with any of those true, the trade is not “cheaper,” it is a different security. - **Trim/exit if held:** trim $\frac{1}{3}$ at **\$68–72** (below the ~\$75 street anchor — we do not need the last leg); full exit on a 13D/A showing Trip.com selling into the tape, or on cash interest post-refi exceeding **\$110M/yr.**

Catalyst dates: - **2026-09-28** — Annual General Meeting, 5:00pm IST, Gurugram. **CONFIRMED, primary** (6-K EX-99.1, 2026-08-07). Governance, not earnings. Low expected information content; the FY26 audited statements and Annual Report on the IR site are the useful artifact. - **~2026-10-17** (estimated) — expected scheduling PR naming the Q2 FY27 print date. **UNCONFIRMED;** based on last year’s ~10-day-prior BusinessWire practice. - **2026-10-27** — presumed Q2 FY27

print. **UNCONFIRMED, yfinance-derived.** ~33 trading days out; our ≤5-day pre-print reconstruction trigger is **not met.** - **2028-02-15** — legacy \$230M 0.00% notes mature; ITM at \$48 ⇒ ~5.93M shares (+6.3%), share-settleable subject to the issuer's settlement election (unverified — item 6 below). - **2028-07-03** — holder cash put on \$1.4375B at 100% of par. **The date that governs everything.**

PRE-PRINT POSITION: FLAT.

ARMED SENSORS

(armed provisionally with this deck; session adjudication ratifies)

- price alert: fires below 32.67 (deck-provisional: 52-week low break - thesis void unless bond >=92 and INR <96)
- filing watch: 6-K until 2027-03-09 (deck-provisional: scheduling PR naming the Q2 FY27 print date - converts 2026-10-27 from yfinance-derived to company-nam)
- dated pack MMYTI2026-09-28: MMYT: Annual General Meeting, 5:00pm IST, Gurugram; FY26 statements audited by KPMG Mauritius (6-K EX-99.1, primary) (date confirmed=True)
- dated pack MMYTI2026-10-17: MMYT: expected scheduling PR (~10 days prior, per prior-year practice) naming the Q2 FY27 print date (date confirmed=False)
- dated pack MMYTI2026-10-27: MMYT: presumed Q2 FY27 earnings print - yfinance-derived, not company-named (date confirmed=False)
- dated pack MMYTI2028-02-15: MMYT: legacy \$230M 0.00% notes mature; ITM at \$38.80 conversion vs \$48 tape => ~5.93M shares (+6.3%) (date confirmed=True)
- dated pack MMYTI2028-07-03: MMYT: holder cash put on \$1.4375B at 100% of principal - the date governing the entire financing leg (date confirmed=True)

What remains unverified

1. **Market price of the 2030 convertible notes.** Decisive for the put question; not fetched by either bench. Drainable today.
2. **FX-hedge status of the USD-denominated notes.** Coverage gap in both benches. In the FY26 20-F debt note, not pulled.
3. **Existence of a committed refinancing facility or capped calls.** Same document, same non-pull. This is the difference between a \$246M gap and a non-event.
4. **FY26 cash from operations from a primary source.** The \$182M figure that carries the entire refi-gap calculation comes from an earnings-call transcript, not from the audited cash-flow statement, because the pack's XBRL block was empty.
5. **SBC and diluted share-count series.** Adjusted operating profit adds back SBC, so per-share economics are unverified without it.
6. **Settlement election on the legacy \$230M notes maturing Feb 2028.** We assert share settlement (+6.3% dilution). If the issuer must or elects to settle in cash, a second cash claim lands five months *before* the July 2028 put.

7. **September-quarter (Q2 FY27) take-rate, cc bookings and AOP.** Private until the print — genuinely time-gated. Estimate: cc bookings **+12% to +18%**, take-rate **−20 to −40 bps** QoQ (basis: the 19.9%/16.1%/8.6% compression already in the record continuing at trend), $p \approx 0.60$.
8. **Company-confirmed print date.** Awaiting the scheduling PR. Estimate: **2026-10-27 ± 3 calendar days**, $p \approx 0.70$ (base rate: prior year's fiscal Q2, before market open, Tuesday Oct 28).
9. **Trip.com's intent regarding its ~17% residual stake.** Private; partially observable only after the fact via 13D/A. Estimate: probability of ≥ 1 disclosed block sale in the next 12 months $\approx 35\%$ (base rate for strategic holders who have already executed one exit tranche at a materially higher price).
10. **Whether a listed options chain with usable liquidity exists on MMYT, and its IV term structure.** Required as the input to the instrument decision below; drainable in minutes via IBKR.

PRIZE TABLE + VOL READ

Time-gated/private items exist (7, 8, 9), so this section is required. **Anchor:** the pack tape, \$48.00. Adjustments are made from that anchor, not from a target.

Scenario	Probability	Price	Contribution
Refi resolved cleanly — bond ≥ 92 or facility disclosed; take-rate flat; INR stabilises; re-rate toward street anchor	0.22	\$75	\$16.50
Muddle-through — refi arranged at a cost, cash interest $\sim \$90\text{--}100\text{M/yr}$, cc growth intact but dollar EPS flat; no re-rate	0.40	\$50	\$20.00
Funding stress / INR grind — bond quoted in the 70s–80s, INR > 98 , take-rate keeps compressing; back to the low	0.28	\$32	\$8.96
Tail up — strategic action, Trip.com stake resolved, clean beat	0.05	\$95	\$4.75
Tail down — discounted equity-linked raise into a weak tape + demand roll	0.05	\$22	\$1.10

EV = \$51.31 vs \$48.00 spot $\Rightarrow +6.9\%$. That is the honest headline: **a thin edge, well inside the error bars of our own inputs** (three of which are unverified). It does not, on its own, justify a position.

Dispersion: $\sigma_{\text{table}} = \$19.16 = 39.9\%$ of spot over the ~9-month table horizon, which annualises to $\approx 46\%$.

Expression math — candidate strikes priced off the table itself ($C_{ours} = \sum p_i \times \max(S_i - K, 0)$, undiscounted, ~9-month expiry):

Strike	C_ours (from the table)	Chain mid	Verdict
\$55 call	\$6.40	NOT PULLED	undecidable
\$60 call	\$5.05	NOT PULLED	undecidable
\$65 call	\$3.70	NOT PULLED	undecidable
\$40 put (CSP)	\$3.14	NOT PULLED	undecidable

IV vs RV, IV percentile, VRP: UNAVAILABLE — no options chain was fetched by either bench, and none appears in the pack. We will not substitute an underlying aggregate IV feed for chain-level midpoint IV; those two numbers diverge badly and we have been burned by exactly that substitution before (the TSSI 71-vs-101 lesson). So the comparison that decides the instrument — σ_{table} 46% annualised versus $IV \times \sqrt{T}$ on real quotes — **cannot be completed**, and item 10 above exists to fix that.

Bimodality: the table is fork-dated. It splits on a single binary (bond ≥ 92 / facility disclosed, or not), producing mass at ~\$75 and at ~\$32 with a thin middle. Structurally, fork-dated bimodality is the setup where **long calls beat stock if IV is cheap versus σ_{table}** , because the stock pays you the mean while the option pays you the fork. If the chain comes back with 9-month IV materially **below 46%**, the honest recommendation flips from “none” to a small call position at \$55–60. If IV comes back **above ~55%**, the fork is already paid for and the route is premium-selling gates (CSP at \$40, where our table says the premium is worth ~\$3.14) rather than long optionality.

TAX OVERLAY. Today is within the 2026 harvest year. Every candidate expiry above (~9 months, i.e. June 2027) puts the loss branch in **tax year 2027** — the loss is deferred out of the harvest year. Our rule excludes deferred-loss expiries during a harvest year **unless the edge numerically dominates**. Here the edge is **+6.9% EV on unverified inputs**. It does not dominate. A December-2026 expiry would land the loss correctly but is too short to span the gate resolution the whole thesis depends on.

INSTRUMENT RECOMMENDATION: NONE — no position, in any instrument, today. That is the output of the arithmetic, not a mood: thin EV (+6.9%), the decisive input (bond quote) unfetched, the instrument-selection input (chain IV) unfetched, and the only expiry long enough to work is tax-disqualified this year. Re-run this entire section the moment items 1 and 10 are drained; the recommendation is expected to change.

```
