

PITCH — MPT — VERDICT

ADJUDICATED 2026-09-16 — FLAT — one-document gap (conviction 7/10). The court found nothing to own at this price; the reopen gates below are the only path back.

What we believe

Medical Properties Trust owns hospital real estate and leases it to operators. It nearly failed on its debt wall and on 8/10/26 it fixed the near-term maturities by issuing \$2.4B of new 9.25% secured notes due 2032 — part new cash, part swapping old unsecured bonds into the new secured ones ([8-K, 8/10/26](#)).

Three things we actually believe:

1. **The refinancing is real and dated.** The 2026 notes get redeemed in full; 2027 gets a partial redemption; roughly \$1.5B of 2027–2031 unsecured paper was exchanged. That is a primary-document fact, not a management claim.
2. **The price of that fix is large and is not in any reported quarter yet.** The new coupon is \$222M/year. Against the old paper it replaced, the *incremental* cash interest is roughly \$96–151M/year (central ~\$122–136M) — about \$0.20/share, or a third of the earnings run-rate the stock looks cheap against. The first cash coupon is 12/15/26.
3. **Therefore the stock is not 6.2x. It is about 8.4–9.5x pro-forma.** Annualized Q2 cash earnings (NFFO) of \$0.60 becomes roughly \$0.39–0.44 after the coupon step-up. At \$3.70 that's 8.4x–9.5x, with a \$0.36 dividend (9.7% yield) eating 82–92% of a non-cash metric.

That is still a discount to healthcare-REIT peers at 12–18x. But it's a *narrower* discount than the bull case claimed, and the remaining gap is compensation for one question we have not answered: **does the rent actually arrive in cash?**

Our honest stance: this is a maybe, not a buy. And we have not yet read the one document that decides it.

What the market believes

- The street models FY26 cash earnings of about **\$0.63** with Q1–Q3 at \$0.14 / \$0.15 / \$0.15 — which forces a rising Q4 of roughly **\$0.19**. That is the opposite of a coupon step-down.
- Published headlines have been negative: two consecutive quarters framed as earnings misses.
- The tape agrees with the bears, not the bulls: the stock printed **new 52-week lows after the 8/10 financing closed** (\$3.99, then \$3.89), and sits at \$3.70 against a 52-week low of \$3.665 — 1% off the low, 41% below the 52-week high. The market read the fix and kept selling.

So the market believes: survival was bought, not solvency; the operators are still shaky; and the dividend is on borrowed time.

Why we might have edge

One clean, gradeable disagreement. Street FY26 is \$0.63. Our pro-forma run-rate is ~\$0.40 — a **36% gap with a named mechanism** (a full year of the 9.25% coupon that no reported quarter contains, and that the street's rising-Q4 shape flatly contradicts). Somebody is wrong in a way that will be settled by arithmetic on published statements, not by opinion.

Note the direction: **our divergence is bearish on earnings and only conditionally bullish on price.** The edge is not "it's cheap." The edge is "the number everyone is quoting is the wrong number, in both directions," which means the re-rating path is knowable before it happens.

Second, a timing edge that is free. The first cash coupon is 12/15/26. Anyone using a single quarter's cash flow as a health check will get a false positive in Q3 (coupon-light) and a false negative in Q4 (coupon-heavy). We know the shape of the distortion in advance.

Third, a document nobody in this court read. The 10-Q filed 8/10/26 contains H1'26 cash flow and the debt footnote that says whether the 2027 residual is actually gone. It is public, free, and same-day available. Both of our own benches set a cash-flow bar without it. That is an embarrassing edge, but it is an edge.

Why it might be priced in

Plainly: most of it probably is.

- The stock fell *after* the financing closed, holding the indenture in hand. The coupon is public. A 9.25% secured coupon on a hospital landlord is not a secret.
- Peer-discount arguments are the most crowded trade in this name and have been wrong for three years.
- The dividend yield of 9.7% is itself the market's statement that it does not believe the dividend.
- Our own table, run at the current price, gives negative expected value. That is the strongest "priced in" evidence in this deck, and it comes from us.

There is also a logical trap we should not fall into, which our blue bench caught: you cannot simultaneously claim "it's fully priced" *and* "the street's \$0.63 is the right anchor we agree with." If the coupon step-up is unpriced by the street's model, then "priced in" is not established; if it is priced, the street number isn't the anchor. We resolve this by treating the *price* as informed and the *published estimates* as stale — which is why we're flat and not short either.

What could go wrong

Failure narrative 1 — The rent was accrued, not received (tripwire exists, but it lags). The step from \$0.14 to \$0.15 was attributed to escalating rent from two recovering operators (HSA/Noor). The coverage metric supporting them (roughly 2.0x cash rent coverage) is **management-sourced and unaudited**. If that rent is being booked and not banked, cash

earnings are materially below reported cash earnings and the dividend is funded by asset sales. Tripwire: deferral-balance and cash-receipt disclosure in the Q3 and Q4 10-Qs — which means we learn one to two quarters late, after the price has moved.

Failure narrative 2 — The new lenders own the asset sales (tripwire exists, weakly). The new notes are **secured**. Standard secured-note covenants require proceeds from selling pledged collateral to be applied to redeeming the notes. If that is the case here, then the “\$172M of asset sales = liquidity for the dividend” leg of the bull case is wrong, and the dividend is riding on operating cash flow alone. We have **never seen the indenture’s collateral schedule or the asset-sale covenant** — only the 8-K’s summary paragraphs. Tripwire: the indenture exhibit, if filed; otherwise the next 10-Q’s debt footnote. This is a better kill than anything our red bench produced and red missed it.

Failure narrative 3 — NO MONITORABLE TRIPWIRE. A private operator’s liquidity fails, or a single foreign government changes hospital reimbursement, and the stock gaps 20–30% before any US filing exists. MPT’s tenants are private companies; their bank lines, payor mix, and supplier terms are not disclosed anywhere we can subscribe to. There is no filing, no permit feed, no satellite image, and no XBRL tag that changes state before this happens. Our own detector sweep confirms the hole: the geospatial and permit detectors were all UNCHECKABLE or NOT-FIRED here, and the one detector that fired (tenant credit) fired only *partially*, because tenant operator financials do not exist publicly.

Unknown-unknown class, named: `unmonitorable_private_counterparty_state` — the solvency and payor-regime state of a non-public counterparty whose lease is load-bearing for our earnings, observable only after it breaks. Sub-class: `unseen_collateral_pool` — we are underwriting a secured structure whose pledged-property list we have never read.

The reflexive / structural leg.

- *Our size vs. liquidity:* We do not have ADV or short interest in this pack — that is a real coverage gap, charged to both benches. Base-rate estimate for a \$2.2B-cap NYSE REIT with this news flow: **15–25M shares/day, \$55–90M notional**. A 0.35x-normal starter is a rounding error against that; **we are not the flow**. We would need to be ~10x this size before our own footprint mattered.
- *The flow that does matter:* this shareholder base is yield-seeking — income funds, REIT index products, and retail. A dividend cut is not a valuation event for that base, it’s a **mandate-violation event**, and the selling is price-insensitive and fast. That is why our downside scenario is a multiple *and* a yield reset at once. Symmetrically, short interest in these names typically runs high (estimate 10–18% of float), so a clean 10-Q can squeeze upward just as violently. Both tails are flow-driven, not fundamentals-driven.
- *Doctrine interactions, stated plainly:* (a) **Crowding is a sizing and timing input, never a reason to reject** — we followed that, and it is also why our unknown crowding does not veto the trade, only shrink it. (b) **Share-count series are a known audited error class**, so red correctly refused to call the missing post-refi share count fatal — it left it UNVERIFIED. Good discipline, but it means a real dilution risk is sitting in the “unknown” bucket rather than the

“priced” bucket. (c) The **quotation-scope doctrine** (only quote what the document says, not what the excerpt truncates) vacated a fatal finding in this court — see the next section. (d) The **single-quarter cash-flow gate** doctrine now says: never set a bar on one quarter of a semi-annual-coupon issuer. Both benches violated it before blue caught it.

If this position loses money, the most likely reason will be **that the rent we underwrote was booked and never collected in cash — and the filing that shows it arrived two quarters after the price did.**

What we checked ourselves

Claim	How checked	Found	Confirmed?
“6.2x annualized cash earnings”	8-K coupon terms × principal, divided by 600.6M shares	\$222M new coupon vs \$71–126M retired → incremental \$96–151M (\$0.16–0.25/sh). Run-rate \$0.39–0.44, i.e. 8.4–9.5x , not 6.2x	NO — refuted. Correction shrinks the discount to peers (12–18x); it does not invert it
“First cash coupon lands in Q3”	Indenture terms: interest payable 12/15 and 6/15, commencing 12/15/26	Aug 10 → Dec 15 accrual = \$77.1M (30/360) / \$77.2M (act/365) , payable in Q4. Q3 pays none of it	Confirmed — both benches agree to within \$0.1M
“\$140M Infracore proceeds coming”	Swiss IPO coverage, cross-checked between benches	Proceeds ~CHF50M (~\$70M), i.e. overstated ~2x , and already received before the gate	NO — magnitude refuted
“Deconsolidation removes revenue/cash flow” (our red bench’s mechanism)	Stake facts: the holding was non-controlling before the IPO	OUR OWN BENCH ERRED. No control existed, so no control was lost, so nothing deconsolidates. Red booked a mechanism that cannot happen	Overturned
“No inflection vs expectations” (red)	Compared the revenue comp red used (\$266.69M) to the quarter it was judging	OUR OWN BENCH ERRED. Red compared Q2 actual revenue (\$259.3M) to the <i>next</i> quarter’s estimate. The beat vs \$248.0M consensus stands; the basis mismatch was red’s	Overturned as a kill; retained as context
“Partial redemption means the 2027 wall is undocumented” → disclosure-inconsistency alarm fired	Read the 8-K sentence <i>after</i> the one quoted	OUR OWN BENCH ERRED. “Partial redemption” describes the cash leg only ; the next sentence says the exchange separately refinanced 2027–31 paper. The alarm was a quotation-scope artifact	Fatal finding vacated
“Dividend is board’s vote of confidence, funded by a GAAP gain of \$30.2M”	Transcript vs bench claim	OUR OWN BENCH ERRED. Q2’26 was a GAAP loss of ~\$0.01/share . Also “REIT mandate forces the dividend” is unproven — this company cut its own dividend in 2023–	Refuted; only the payout math survives (\$216M vs ~\$234–264M pro-forma = 82–92%)

Claim	How checked	Found	Confirmed?
		24, which is proof of discretion	
“S-8 filing four days before close = equity coming”	What an S-8 does	OUR OWN BENCH ERRED. An S-8 registers employee-plan shares; it cannot raise capital. Consistent with \$17.7M/qtr stock comp and the Form 4 clusters	Inference overturned; share count still unverified (item 2 below)
Stock comp +131% year over year	Pack XBRL, same-quarter comparison	\$17.665M (Q1’25) vs \$7.633M (Q1’24) — real, non-cash, share count flat. A governance flag, not a valuation flag	Confirmed
“Cash flow is near zero (\$384K)”	Pack XBRL date labels	BOTH OUR BENCHES ERRED. The cash-flow series contains only Q1 period-ends — an extraction artifact of year-to-date reporting. \$384K is one coupon-light quarter, and both benches built a “\$60M/quarter” bar on it. Correct metric is 9-month or trailing-twelve-month	Artifact confirmed; bar discarded
“Priced in” vs “street is the anchor”	Internal consistency of the bear case	Cannot hold both. Resolved as: price informed, published estimates stale	Confirmed as a live tension, not resolved in our favor
Tape facts	Pack vs bench restatements	Red silently restated \$3.70→\$3.71 and 1.0%→1.2% off the low. Immaterial, but editing the evidence pack without flagging it is a process failure	Noted
Detector sweep completeness	Dispatch list vs what was consulted	OUR OWN BENCH ERRED. Red skipped two required atlas entries and consulted two that weren’t dispatched — then based a contest on one of the non-dispatched ones	Procedural failure, logged

(No SCIENCE BRIEF was supplied in the inputs and this is not a deep-tech name, so that section is omitted.)

PROPOSED ENTRY BANDS

No entry today. No immediate order. Reasons, in order: (1) the binding document — the 8/10/26 10-Q cash-flow statement and debt footnote — is unread; (2) the scenario table gives negative EV at \$3.70; (3) the decisive cash quarter is Q4’26, not Q3’26.

REOPEN BAND A — document-gated starter (can trigger today, at the right price). All three must be true: - 10-Q (accession 0001193125-26-342583) shows **trailing-twelve-month operating cash flow $\geq$ ~\$440M**, i.e. enough to cover pro-forma cash interest of \$222M plus \$216M of dividends. Do **not** use any single-quarter figure. - 10-Q debt footnote shows the **2027 residual maturity $\approx$ zero** (or fully addressed by committed facilities). - Price **$\leq$ \$3.40**, and ideally **\$3.20–3.40** (= 8.0–8.5x pro-forma \$0.40). At \$3.20 the post-drain table gives +18%; at \$3.70 it gives +2% — the price band *is* the edge. - Size: **0.35x normal**, common stock. Not more, because crowding and trading liquidity are unmeasured (see item 8).

REOPEN BAND B — first add (earliest 12/16/26). - The 12/15/26 coupon of **\$77.1M** is paid from cash on hand with no revolver draw, **and** - Q3'26 filing shows cash rent received from HSA/Noor with **no growth in the deferred-rent balance**, **and** - Price $\leq$ \$4.10 ($\approx$ 10x pro-forma). Take size to **0.7x normal**.

REOPEN BAND C — full size (earliest Q1'27 print, ~May 2027). - Q1'27 is the **first quarter carrying a normal full-coupon load**. If cash flow in that quarter annualizes above ~\$440M and the dividend is intact, go to **1.0x normal** up to \$4.80 (12x pro-forma — the low end of the peer band).

TRIM / EXIT (apply whether or not we've added): - **Dividend cut announced** → exit on the print, do not wait for the price. Cut math: a 40% cut is \$0.216/share; at an 8.5% yield that is **\$2.54**, i.e. $\sim$ 31% below spot. - 10-Q or any 8-K shows **asset-sale proceeds captured by the secured notes' covenant** → exit; the liquidity leg of the thesis is gone. - Deferred-rent balance **grows two quarters in a row** → exit regardless of headline earnings. - Post-refi diluted share count **> 615M**, or any warrant/equity kicker found in the exchange-and-purchase agreement → cut size by half and re-underwrite. - Hard stop: **close below \$3.30** with no change in the documents → out, re-examine.

Catalyst dates: 8/10/26 10-Q — *available now, unread*; **2026-10-29** Q3 print — **UNCONFIRMED** (derived from a data vendor; no company press release names it; Q1 was announced 4/30 and Q2 on 8/6, so late-Oct to early-Nov is the plausible band); **2026-12-15** first cash coupon (\$77.1M) — confirmed by the indenture; **~mid-Feb 2027** Q4 print (first post-coupon cash quarter); **~May 2027** Q1'27 print (first full-coupon quarter).

ARMED SENSORS

(armed provisionally with this deck; session adjudication ratifies)

- price alert: fires below 3.3 (deck-provisional: hard stop if already long and documents unchanged)
- filing watch: 10-Q until 2027-03-10 (deck-provisional: cash-flow statement (TTM, never one quarter) and debt footnote showing the 2027 residual - the binding)
- dated pack MPTI2026-08-10: MPT: 10-Q already filed - H1'26 cash flow and debt footnote available now, unread by both benches (date confirmed=True)
- dated pack MPTI2026-10-29: MPT: Q3'26 print - tests rent cash conversion, pays no new coupon (date confirmed=False)

- dated pack MPTI2026-12-15: MPT: first cash coupon on the \$2.4B 9.25% notes: \$77.1M (30/360) / \$77.2M (act/365) (date confirmed=True)
- dated pack MPTI2027-02-15: MPT: approx Q4'26 print - first quarter containing a real coupon outflow; the decisive cash quarter (date confirmed=False)
- dated pack MPTI2027-05-10: MPT: approx Q1'27 print - first full normal-coupon quarter; Band C gate (date confirmed=False)

What remains unverified

1. **Trailing-twelve-month and H1'26 operating cash flow.** The load-bearing number for everything. *Drainable today* from the 8/10/26 10-Q. Both benches missed it; blue called this the strongest single finding in the court, and it is charged to both.
2. **Post-refinancing diluted share count, and whether the exchange-and-purchase agreement carried warrants or an equity kicker.** Last audited count is 600.594M as of 3/31/25 — five quarters stale. *Drainable today* (10-Q equity note + agreement exhibit).
3. **The 2027 residual maturity after “step two.”** The 8-K documents only a *partial* 2027 redemption; the full two-step plan against ~\$2.7B of 2026–27 maturities was described only verbally. *Partly drainable today* (10-Q debt footnote); step-two completion is a future 8-K.
4. **Secured-note asset-sale covenant — are disposition proceeds swept to redeem the notes?** If yes, the asset-sale liquidity leg and the dividend both weaken. Indenture exhibit not pulled by either bench.
5. **The collateral schedule — which properties are pledged.** Unknown, and it blocks any hazard/concentration work on the secured pool.
6. **HSA/Noor cash rent vs. accrued rent, and the deferred-rent balance.** Genuinely gated: the operators are private and the disclosure arrives with the Q3 filing. The 2.0x coverage figure is management-supplied and unaudited; management's own language was hedged (“cautiously optimistic”).
7. **Q3'26 and Q4'26 operating cash flow.** Time-gated. Q4 is the first quarter containing a real coupon and is therefore the decisive one.
8. **Average daily volume, short interest, borrow, and institutional concentration.** Not in the pack; no discovery access in either bench.
9. **Exact Infracore residual stake and lockup expiry.** The two benches disagree: 48.5% vs 49.9% (47% if an option is exercised). Unresolved between our own sources.
10. **Q3'26 earnings date.** Vendor-derived, not company-confirmed.
11. **Options chain — real quotes and chain-level implied vol.** No chain in the inputs; every option idea below is therefore arithmetic without a market to trade against.
12. **Whether the board declares the next two dividends.** Discretionary — this board has cut before.

PRIZE TABLE + VOL READ

Both benches marked the prize table “N/A per mandate,” on the grounds that this is a revenue-generating operating REIT rather than a pre-revenue developer needing a magic-funding counterfactual. **We accept that reasoning for the funding counterfactual and reject it for this section.** Items 4, 5, 6, 7 and 12 above are genuinely time-gated or private, which triggers the requirement. Here is the table.

Horizon: the Q4’26 print, ~mid-Feb 2027 ($T \approx 0.43$ years). Anchor: spot \$3.70 = 9.25x pro-forma NFFO of \$0.40. Adjustments from the anchor, not from a blank page.

Scenario	Prob.	What happens	Price	Math
A. Cash converts, wall cleared	30%	TTM cash flow covers \$222M interest + \$216M dividend; 2027 residual $\approx$ zero; dividend held	\$4.60	11x on \$0.42 — still below the peer band
B. Muddle through	35%	Cash flow covers interest but payout stays $\sim 90\%$ +; step two undocumented; no re-rating	\$3.60	9x on \$0.40 ($\approx$ today)
C. Rent was accrual	25%	Deferred-rent balance builds; dividend cut $\sim 40\%$ to \$0.216; income holders exit	\$2.50	\$0.216 at an 8.5% yield = \$2.54
D. Covenant capture + forced equity	10%	Asset-sale proceeds swept; 2027 residual needs equity; dilution at distressed prices	\$1.60	Stub-equity re-rate

EV = \$3.43 vs. spot \$3.70 $\rightarrow$ -7%. NO ENTRY. Re-run assuming the 10-Q drains favorably (A 45 / B 35 / C 15 / D 5): **EV = \$3.79, or +2% at spot** — still not enough. At **\$3.20** the same post-drain table gives **+18%**. That is precisely why the entry band is \$3.20–3.40 and not “at market.”

Vol read. Table dispersion: $\sigma_{\text{table}} = \$0.99 = 26.6\%$ of spot over 0.43 years $\approx 41\%$ annualized. The distribution is **bimodal, not bell-shaped** — mass sits at \$4.60 and \$2.50 with a thin middle, and it is fork-dated on two hard events (the 12/15 coupon payment and the Q4 print). Bimodal, fork-dated payoffs are exactly the case for convexity rather than stock.

Expression math (shown, with its own failure disclosed). Calls priced straight off the table, $C_{\text{ours}} = \sum p_i \times \max(S_i - K, 0)$, Feb’27 expiry:

- $K = \$4.50 \rightarrow$ **\$0.03**
- $K = \$4.00 \rightarrow$ **\$0.18**
- $K = \$3.00 \rightarrow$ **\$0.69** (intrinsic \$0.70 — the table pays *nothing* for time)
- $K = \$2.50 \rightarrow$ **\$1.02** vs \$1.20 intrinsic — **the table values a deep in-the-money call below intrinsic**, which is just the negative EV showing through

Comparison to the chain: cannot be done. There is no options chain in the inputs. So we cannot state IV, cannot state an IV percentile, and cannot compute the volatility risk premium (IV – RV). Anyone who fills those numbers in from an aggregate feed for the underlying instead of chain midpoints repeats the TSSI error (aggregate feed 71 vs. actual chain 101 — a divergence that flips the entire cheap/rich conclusion). **We will not fabricate the comparison.**

Instrument recommendation — the output of the arithmetic above: NONE now; COMMON STOCK when Band A triggers. The chain would have to show midpoint IV **materially below ~41%** at a ~5-month tenor before calls beat stock, and we cannot see the chain. Premium-selling gates (covered calls / cash-secured puts) are unreachable for the same reason and are additionally unattractive while the downside tail (C+D = 35%) is this fat.

Tax overlay. Every catalyst that actually resolves this — the 12/15/26 coupon, the ~Feb-2027 Q4 print, the ~May-2027 full-coupon quarter — requires an expiry in 2027. **The loss branch of any such option lands in the wrong tax year**, deferring the deduction past Dec 31, and is therefore excluded during a harvest year unless the edge numerically dominates. It does not: EV is –7% at spot and +2% even post-drain. A January-2027 expiry would land the loss in-year but expires before the Q4 print, so it buys nothing. **Conclusion: no options in 2026. If we enter, we enter in common stock, where the loss is realizable at will inside the intended tax year.**

Conviction: the reject case ran 8/10 on its own terms but lost two of its fatal findings on review; the net “narrower discount, unknown cash conversion, stay flat” reading ran 7/10. We are proposing the flat-with-bands version of that, and we are proposing that someone read the 10-Q today.

ADJUDICATION — 2026-09-16 15:36Z

Strongest finding is a coverage gap charged to both benches: H1-26 OCF unread, so cash conversion vs ~\$222M pro-forma interest + \$216M dividend is unknown. Pro-forma multiple 8.6–9.2x, not 6.2x.

REOPEN GATES: Read the H1-26 10-Q cash-flow statement (same-day drainable): if TTM OCF covers interest + dividend → starter ≤0.35x normal, defined-risk; else dead

PROCESS: both benches skipped a same-day-available document
