

PITCH — SOFI — VERDICT

ADJUDICATED 2026-09-16 — WATCH — band \$16.50 (conviction 7/10). The court found nothing to own at this price; the reopen gates below are the only path back.

What we believe

SoFi is a real, profitable, deposit-funded lender that got cheap for a reason that has nothing to do with the reason our original brief argued about. The brief said “the market is pricing a credit event, and credit is fine.” Half of that is right: on the primary filings, credit is fine-to-improving. The other half is wrong: the market is not pricing a credit event.

What we actually believe, stated plainly:

1. **Credit is not deteriorating on a like-for-like basis.** Personal-loan charge-off dollars fell sequentially (~\$186M → ~\$171M) even as the book grew, the unscrubbed “all-in” personal-loan loss rate fell 70 basis points in Q2, and the vintage loss curves — matched at like amounts of loan balance remaining, which is the seasoning control that matters — showed 2024/25 cohorts beating older ones by a *widening* gap (4.68% vs 6.43% in Q2, wider than Q1’s 4.64% vs 6.32%).
2. **The deposit-flight story is dead.** Deposits \$45.5B, up \$5.3B in the quarter; net interest margin 5.98%; net interest income +52%.
3. **The book value is real and mostly earned, not printed.** Share count grew only ~0.7% quarter-over-quarter (stock comp only). The +16% year-over-year count is one discrete \$1.5B underwritten stock sale in 2025 — done, in the past, and priced above book, which is why book value per share still rose ~56% to \$7.34.
4. **But what is actually pressuring the stock is the rate path and balance-sheet intensity, not losses.** The guide is re-based on one-to-two Fed hikes; the fair-value loan markdowns were driven by a higher discount rate; a fresh sell-side Hold initiation (Loop Capital, 2026-09-09) cited rate-hike risk and a mix shift toward capital-heavy lending. The stock fell 8.9% on a print with revenue +43% and net income +61%.
5. **Therefore we have no differentiated view worth paying 2.45x book for.** Our best refutation refutes an argument nobody is making. At \$18.01 that is 2.45x tangible book and 30x the \$0.60 earnings guide, after a ~+17% rally off the post-print low and ~+21% off the 52-week low. The prize table below prices the next three months at an expected \$16.72 — about 7% *below* the tape.

Position: flat. Buy only lower, and only after we run the one dataset neither bench ran.

What the market believes

- **Consensus for Q3-26:** roughly \$0.17 of earnings on ~\$1.26B of revenue (single-vendor; a second vendor still shows a stale \$0.11 / \$1.14B, so even the consensus number is soft). Revisions over 90 days: 5 up, 9 down.
- **Analyst price targets sit above the tape:** ~\$21.41 (31 analysts), ~\$20.26 (25 analysts), ~\$22.19 (16 analysts). So the sell side is mildly bullish, not bearish.
- **The bearish anchors below the tape are one vendor's model at two vintages** (\$13.62 and \$16.40) — not two independent marks, which our red bench initially mis-sold as two.
- **The marginal seller's stated reason is rates and capital intensity**, plus a cap on incremental profit: the revenue guide went up to \$4.75–4.85B while the EBITDA guide stayed at ~\$1.6B — the raise carried no extra profit.
- **The market also believes the full-year math needs a big Q4:** actual Q2 \$0.12 + street Q3 \$0.17 means Q4 must be roughly \$0.23 to hit \$0.60.
- **The short base is meaningful but not the story:** last-known short interest 133.3M shares, ~11.4% of float, versus ~30.4M shares (~\$550M) of average daily volume, so about 4.4 days to cover. That data is a February-2026 vintage and is stale.

Net: consensus is “good company, capped profit, rate risk, fairly valued.” That is our view too. Same view, no edge.

Why we might have edge

Honest list, weakest to strongest:

1. **One clean dataset nobody has pulled.** SoFi Bank, N.A. (RSSD 962966; total assets ~\$49.67B, deposits ~\$42.32B) files regulatory call reports with *unadjusted* past-due, charge-off and reserve figures. That series is immune to the loan-sale scrub described below. Both benches called it unchecked-but-retrievable, and both said the earlier decision to dismiss it was wrong. If bank-level past-dues are flat-to-falling, the loudest bear claim dies with public data, before the print.
2. **A repeatable mechanism we now own.** The company sells delinquent loans *before* they charge off and headlines a loss ratio that explicitly excludes them (Q2: \$94.3M of unpaid balance sold for \$13.6M, an \$80.7M realized loss, kept out of the charge-off numerator). That is a genuine detection pattern for other consumer lenders. Here it does not change the direction of the numbers — the unscrubbed rate fell too — but the mask *shrank* year over year (sale balances were flat at ~\$94M on a 42%-larger book), which is itself mildly good news that nobody is publishing.
3. **A possible sequential inflection the year-over-year comparisons hide.** The technology-platform segment looks terrible year over year (revenue \$84.5M, –23%; contribution profit \$11.8M, –65%; enabled accounts 135M vs 160M) but two of three series turned up sequentially (+13% revenue, +2M accounts), and the ugly comparison lapses in Q4 because the lost client finished exiting before end-2025.

4. **Almost nobody is modelling the capital-light mix as the checkable axis.** Only \$3.1B of \$14.8B of originations went through the loan-platform/fee route this quarter. That fee-versus-balance-sheet mix, not credit, is the number that decides the multiple. It is disclosed quarterly and it is not in most models' foreground.

Why it might be priced in

- **Our conclusion equals the published conclusion.** “De-rating, not impairment” is consensus. There is no gap to be paid for.
- **The re-rate is already partly delivered.** The stock closed 15.25 the day after the 7/29 print and has drifted +17% in the 33 days since, range 15.26–19.50. We would be buying the recovery, not the dislocation.
- **The valuation is not cheap on the metric that matters.** 2.45x tangible book, 30x the guide, versus a business whose own guide says extra revenue brings no extra profit.
- **The improving credit numbers are structurally flattered even where they are honest.** A book originating ~\$10.7B of personal loans a quarter is younger than its own loss curve; and \$29.7B of loans carried at fair value means credit stress can show up as marks in non-interest income rather than charge-offs at all. So a clean charge-off series cannot *certify* health — a point our red bench made well and our blue bench upheld.
- **The rate risk is genuinely un-edgeable by us.** If the guide's one-to-two hikes become three, the multiple compresses and nothing in our research kit sees it coming first.

What could go wrong

Failure narrative 1 — We buy a re-rate that is already 17–21% delivered, and the tape simply mean-reverts to the vendor model. Tripwire exists and is monitorable: a close below \$16.50 (the pre-drift level, 2.25x book) invalidates the “the drift is real” premise; a close below \$15.25 (post-print close) says the print reaction was right and the drift was noise. Monitorable via price gates below. This is the most likely, least dangerous failure: it costs money slowly.

Failure narrative 2 — Rates, not credit, break it. The guide assumes one-to-two hikes and a 22% tax rate that management called ~700 basis points above the original plan (a transcript number we never diffed against the 8-K — flagged as unchecked by red and still unchecked). Three hikes, or a funding-cost step-up, and both the earnings bridge (Q4 needing ~\$0.23) and the multiple go at the same time. Partly monitorable — Fed calendar, forward curve, the fair-value note's discount-rate language — but our tripwires are lagging, because the fair-value note only lands with the 10-Q ~a week after the print.

Failure narrative 3 (NO monitorable tripwire) — a private, contract-level or supervisory event. Warehouse-facility covenant renegotiation, a whole-loan buyer stepping away, a repurchase-obligation dispute, a bank-charter condition or consent order from the primary regulator, or a Technology-Platform client exit we cannot see. The 10-Q's own tagging shows facilities, trusts and repurchase-obligation concepts; the size and terms of those private arrangements are not in any feed we own, and supervisory actions are typically disclosed *after* they bind. We flagged this in the detector sweep: the customs/import instrument that normally

identifies a concentrated customer **cannot see a software client** — a real coverage gap on the exited Tech-Platform client (~25M enabled accounts) with no substitute instrument. **Unknown-unknown class named: PRIVATE-CONTRACT / SUPERVISORY-ACTION CLASS — information that exists only inside a bilateral contract or a regulator’s confidential supervisory file, and is therefore unobservable until it is announced.** There is no sensor we can arm for this. The only defence is size.

The reflexive / structural leg. - *Our own size versus liquidity*: trivial. Average daily volume ~30.4M shares (~\$550M). A 1/4-size starter at 0.5% of book is a rounding error against that — well under a minute of tape. **We create no impact and we can exit in one print. Liquidity is not the risk; that also means liquidity is not an excuse for a bigger size.** - *Predicted flow that is not ours*: short interest 133.3M shares / ~11.4% of float / ~4.4 days to cover on a stock that just rallied 17%. That flow works *against* our reopen bands — a squeeze can hold the price above \$16.50 indefinitely and we simply never get filled, or we get filled only on a real fundamental break, which is the fill we least want. This asymmetry is the main reason a limit-only reopen plan can quietly become “long at a bad price or never long.” - *Doctrine interactions*: two of our own doctrines collide here. The “damage-absent” doctrine says a clean, primary-sourced refuting metric upgrades a name. The “misaimed refutation” pattern says a valid refutation of a narrative the marginal seller is not trading has *zero* price consequence. SOFI is precisely the case where doctrine 1 would have sized us in and doctrine 2 correctly stops us. Separately, the pre-charge-off delinquency-sale mechanism means our standard credit screen can be satisfied by a *constructed* metric — if we let that screen alone authorize entry on the next consumer lender, we will be wrong there and blame SOFI. - *Reflexive risk in our own process*: the evidence pack’s quarterly revenue block was wrong (it showed \$151.89M where consolidated revenue is ~\$1.22B). Both benches caught it and refused to compute on it. If a future deck runs share-count, stock-comp or cash-flow math off that block, the error propagates into sizing.

The blank, filled: not credit, but the rate path plus the profit cap — we pay ~2.45x book for a lender whose own guide adds revenue without adding profit, then a third hike re-rates it to 2x while our credit work stays perfectly correct and perfectly irrelevant.

If this position loses money, the most likely reason will be ____

What we checked ourselves

Claim	How checked	Found	Confirmed?
Pack price 17.315 is the tradeable price	Live quotes (multiple vendors, Sep 8–9 2026)	17.88–18.13; we use \$18.01 as the working mark	Superseded — pack stale ~4%; every valuation line in the original brief (quoted at 16.995) inherits a ~6% error
Drawdown / distance off low	Recompute off live mark	At \$18.01: –45.0% from the \$32.73 high, +21.0% off the \$14.88 low (pack said –47.1% / +16.4% at its own stale price)	Confirmed — pack figures are arithmetically right <i>for the pack’s price</i> ; the divergence is supersession, not error
OUR RED BENCH: “2.45x book, 30.0x guide”	Recompute at both marks	At 18.01: 2.454x / 30.0x — correct. But red used those to	Bench error (minor) — right numbers, mismatched

Claim	How checked	Found	Confirmed?
		attack a brief quoted at 16.995 without restating both sides at one price	comparison; blue's 2.44x / 29.8x at 17.88 is equally price-dependent
OUR BLUE BENCH: drawdown quoted –45.4% vs pack –47.1%	Runner flag + recompute	Legitimate: –45.4% is exactly 17.88 against the 32.73 high. Supersession declared, not fabrication	Bench cleared — but the deck must always print the price alongside any drawdown or multiple, or the runner will keep flagging it
“Charge-off ratio improved, so credit improved”	10-Q primary tables (sofi-20260630)	Personal-loan charge-off <i>dollars</i> +31.6% year over year on a 42% bigger book; ratio 2.62% vs 2.83%. So year-over-year improvement is partly a denominator effect	Partly refuted — as originally stated the claim overreached
OUR RED BENCH: “the ratio only falls because the denominator compounds”	Sequential read of the same tables	Sequentially, personal-loan charge-off dollars <i>fell</i> (~\$186M → \$171M) on a <i>larger</i> book. A growing denominator cannot shrink a numerator. Red tested only the axis that flattered its own case	Bench error — reduced from fatal to a year-over-year-only caveat
Delinquent loans are sold before charge-off and excluded from the headline ratio	10-Q footnote (4) + loan-sale table	Confirmed: \$94.3M unpaid balance sold for \$13.6M, \$80.7M realized loss, outside the charge-off numerator	Confirmed — mechanism real
OUR RED BENCH: “3.03% is the all-in rate, up 23bps”	Filing vs transcript	3.03% is the <i>filed</i> Q1-26 personal-loan ratio, not the all-in rate. Management's all-in Q2 rate was 3.7%, down 70bps sequentially	Bench error — the unscrubbed series moves the same direction as the scrubbed one; the kill does not carry the sign
Charge-offs are the right credit instrument here	10-Q fair-value note + Q2 balance sheet	No: \$29.7B of loans held at fair value (vs \$22.7B at 12/31/25). Deterioration can arrive as marks, not charge-offs	Confirmed against us — our clean charge-off series cannot certify health
What actually drove the fair-value markdowns	10-Q fair-value note language	A higher weighted-average discount rate, plus “modest increases” in the default-rate assumption	Confirmed — mostly a rate story, with a small credit tick we should not hide
Vintage loss curves are an apples-to-apples control	Company vintage disclosure	They are matched at like loan balance remaining — the seasoning control red demanded — and the favourable gap widened (4.64%→4.68% vs 6.32%→6.43%)	Confirmed for us — this one is a genuine bull data point
Tech Platform is the real bear case	10-Q segment note + Q2 print	Worse than briefed year over year (\$84.5M, –23%; contribution profit \$11.8M, –65%; accounts 135M vs 160M) but +13% and +2M	Confirmed as material, not fatal

Claim	How checked	Found	Confirmed?
		sequentially, with the ugly comparison lapsing in Q4	
“Two independent fair-value anchors sit below the tape”	Vendor check	\$13.62 and \$16.40 are the <i>same vendor at two vintages</i> . Every analyst anchor is above the tape	Bench error (red) — overturned
“Book value was issued, not earned”	10-Q equity note (red’s own stated coverage gap, closed by blue)	Shares 1,281.4M → 1,290.3M quarter over quarter (+0.7%, stock-comp only); the +16% year over year is one 2025 \$1.5B offering; Q2 book value grew \$225.8M against \$156.6M of net income	Bench error (red) — overturned as a valuation argument; issuing above book is accretive, not circular
Deposit flight	Q2 balance sheet	Deposits \$45.5B, +\$5.3B in-quarter; margin 5.98%; net interest income +52%	Refuted (premise dead)
Share-overhang / lockup risk	Equity note + filing list	No live de-SPAC lockup; the issuance already happened; recent Form 4s are routine	No live overhang
Evidence-pack quarterly revenue block (\$151.89M)	Cross-check to Q2 print (\$1.22B revenue, \$156.6M net income)	Pack block is not consolidated revenue; unusable	Pack error — both benches correctly refused to run stock-comp / share / cash-flow math off it. No such math appears in this deck.
Earnings-date confidence	Filing list through 2026-08-24 + three vendors	Vendors disagree: 10/26, 10/27 (marked unconfirmed), 10/28–29 (“company has not announced”). No 8-K or press release confirming	Unconfirmed — treat all dates as soft
OUR BLUE BENCH: “prize-table mandate not applicable, this is a profitable lender”	Directive text	The mandate triggers on genuinely time-gated or private unverified items, not on pre-revenue status. Several such items exist (Q3 segment profit, fair-value assumptions, guide bridge)	Bench error — mandate applies; table supplied below
Science brief in inputs?	Input scan	None; SOFI is a consumer lender, not a deep-tech name	Section correctly omitted (no science brief exists to digest)
Detector sweep hygiene	Both benches’ lists	Several detectors were dispatched that cannot apply here (beauty-category tools, city permit feeds for cities where the company has no site, satellite build-out, hazard indices on unsecured consumer collateral)	Confirmed — dispatch false positives; noted so we stop paying attention to their “not fired” status as if it were information

PROPOSED ENTRY BANDS

No entry today. This is a no-entry verdict with reopen bands. Working mark \$18.01 (2.45x tangible book of \$7.34/share, 30.0x the \$0.60 guide).

Reopen band 1 — starter. Limit **\$16.50 or lower** (blue bench's pre-drift level = 2.25x book, 27.5x guide). Size: **1/4 of a full position (0.5% of book)**. Three gates, all must be true at the time of fill: - (i) Q3 Technology-Platform contribution profit **> \$15M** (red bench's own change-my-mind threshold), *or*, pre-print, no further sequential decay in the segment; - (ii) SoFi Bank, N.A. call report (RSSD 962966) shows 30/60/90-day past-dues and charge-off rates **flat or falling** on the bank's unadjusted book; - (iii) loan-platform/fee share of originations **≥ \$3.1B and rising** (i.e. the capital-light mix is not reversing further). If gate (ii) has not been pulled, **do not fill** — it is public and free.

Reopen band 2 — add. **\$15.25 → \$14.88** (the post-print close, 2.08x book; and the 52-week low, 2.03x book). Add a second 1/4 (to 1.0% of book) **only if gate (ii) is clean**. If we are filled here *because* past-dues turned, this is a stop, not an add.

Hard stand-down. A weekly close below **\$13.62** (1.86x book, the low vendor model), *or* a 10-Q fair-value note showing a rising default assumption **and** a rising discount rate together, *or* Tech-Platform contribution profit **< \$8M** → no entry for one full quarter, re-open the file after the next print.

Trims / exits (only relevant if filled). Trim half at **\$21.00–22.00** (2.86–3.00x book; the analyst-target cluster of \$20.26–22.19 and the top of our scenario table). Full exit on any of the stand-down triggers above. Do not chase above \$18.50 under any circumstance — that is 2.52x book for a consensus view.

Catalyst dates. - **2026-10-27 — Q3-26 print. UNCONFIRMED**, vendor range 10/26–10/29, no company announcement in the filing record through 2026-08-24. ~33 trading days out, so the short-fuse pre-print reconstruction rule is *not* triggered. - **~2026-11-05 (estimated) — Q3 10-Q**, carrying the fair-value note, the segment note and the loan-sale footnote. Estimated as print + ~7 days, the Q2 lag (print 7/29, 10-Q 8/6). Unconfirmed. - **~2026-11-30 (estimated) — Q3 bank call report becomes public** (regulatory filing is due ~30 days after quarter end; public release runs later). This is the gate-(ii) refresh. - **2026-11-20 — November monthly option expiry** (third Friday), the only expiry that keeps a loss branch inside the 2026 tax year comfortably. - **Next Fed decision — date not in the pack; must be pulled from the official calendar before any expression is chosen.** Do not model it from memory.

ARMED SENSORS

(armed provisionally with this deck; session adjudication ratifies)

- price alert: fires below 13.62 (deck-provisional: low vendor fair value = 1.86x book; weekly close below = hard stand-down for one quarter)
- filing watch: 8-K until 2027-03-09 (deck-provisional: confirms the Q3 earnings date and any guide change; kills the three-vendor date guess)

- dated pack SOFI2026-10-27: SOFI: Q3-26 earnings print — UNCONFIRMED, vendors split 10/26 to 10/29, no company announcement (date confirmed=False)
- dated pack SOFI2026-11-05: SOFI: estimated Q3 10-Q filing (print + ~7 days, matching the Q2 lag) — fair-value and segment notes (date confirmed=False)
- dated pack SOFI2026-11-20: SOFI: November monthly option expiry — last expiry keeping a loss branch inside the 2026 tax year (date confirmed=True)
- dated pack SOFI2026-11-30: SOFI: estimated public availability of Q3 SoFi Bank N.A. call report (RSSD 962966) — refreshes credit gate (ii) (date confirmed=False)
- dated pack SOFI2026-12-31: SOFI: tax-year boundary — expiries beyond this date are excluded during harvest years (date confirmed=True)

PRIZE TABLE + VOL READ

Anchored on the live mark \$18.01 and adjusted from there, not built up from scratch. Book value per share \$7.34 is the ruler; multiples shown so the reader can see the adjustment.

#	Scenario (by ~2026-11-20)	Prob.	Price	Multiple of book
A	Q3 beats (EPS $\geq$ \$0.18), Tech Platform contribution profit $>$ \$15M, fee mix rising, rate fear fades	0.20	\$22.00	3.00x
B	In-line (\$0.17 / \$1.26B), segment flat, rate question unresolved — range-bound	0.35	\$18.50	2.52x
C	Q4 bridge to \$0.60 walked down, or profit cap re-affirmed on higher revenue	0.25	\$14.70	2.00x
D	Fair-value note shows default assumption rising <i>with</i> discount rate; intensity worsens	0.12	\$11.75	1.60x
E	Two-plus further hikes, margin compresses, capital-light pivot fully reverses	0.08	\$9.50	1.29x

Expected value = \$16.72, i.e. -7.2% versus the \$18.01 tape. Probabilities sum to 1.00. That negative expected value *is* the reject. Dispersion of the table: **$\sigma_{\text{table}} = \3.85** (23.0% of expected value; 21.4% of spot).

Vol read — and the honest limit on it. There is no options chain in the evidence pack. No implied volatility, no percentile, no realized-volatility series, no quotes. So the required implied-versus-realized comparison, the volatility-risk-premium number and the percentile **cannot be**

computed here, and it would be worse than useless to substitute a remembered or aggregate figure — the underlying's aggregate volatility feed and the chain's own midpoints diverge badly (the TSSI case: 71 versus 101 on the same name, same day). Chain pull is item 5 in the unverified list.

What we *can* publish now is the arithmetic the chain must be tested against, so the instrument choice is an output rather than a preference:

- **Volatility the table itself implies:** 21.4% of spot over 71 days ($T = 0.194$, $\sqrt{T} = 0.441$) → **~48.5% annualized**. That is the threshold. If chain-level midpoint implied volatility for November comes in **materially above ~48%**, our own scenario spread is *narrower* than the options market's — the premium is rich relative to our view, and the correct expression is **premium-selling into the reopen bands**, not buying calls. If it comes in **materially below ~48%**, gated upside may be bought as calls.
- **Candidate strikes priced off the table** ($C_{ours} = \sum p_i \times \max(S_i - K, 0)$, Nov-20 expiry):
- **Nov \$20 call: $C_{ours} = \$0.40$.** Only scenario A pays. Buy only if the chain's real ask is below ~\$0.40, which on a 21%-off-the-low stock is unlikely.
- **Nov \$17.50 call: $C_{ours} = \$1.25$.** Scenarios A and B pay. Buy only below ~\$1.25 ask.
- **Nov \$15 put (cash-secured, our preferred *shape*): fair value = \$0.905.** Assignment at \$15 lands us inside reopen band 2 — a price we said we want. Sell only for a real bid **above ~\$0.91**, and only sized so full assignment equals the 1/4-size starter.
- **Nov \$16 put: fair value = \$1.355** — assignment at \$16 is inside reopen band 1; same rule, sell only above ~\$1.36.
- **Shape of the table:** single-peaked at B with a fat left tail (0.45 probability mass below \$15, versus 0.20 above \$18.50). **Not bimodal** — this table is not fork-dated on a binary event, because the print is a continuous surprise, not a yes/no gate. That argues against long straddles/strangles and in favour of the put-sale shape if, and only if, the premium clears fair value.
- **Instrument recommendation, as the output of the above: NONE today.** Stock is rejected on negative expected value (−7.2%). Long calls are rejected because our table's implied ~48.5% is below what a stock like this typically carries — the premium is probably against us, and we cannot prove it without the chain. The only expression the arithmetic supports is **cash-secured puts at \$15–16 struck inside our own reopen bands, priced above \$0.91 / \$1.36 respectively, at chain midpoints from real quotes** — and that is *gated*, not authorized, until the chain is pulled.

Tax overlay. Nov-20-2026 expiry puts the loss branch inside the 2026 tax year, which is what a harvest year requires. **Any expiry in January 2027 or later is excluded** — it defers the loss out of the intended year, and nothing in the numbers above dominates strongly enough to justify that (a −7.2% expected value cannot “numerically dominate” anything). If we are in a harvest year and only a 2027 expiry is liquid, the answer is no trade rather than a deferred loss.

What remains unverified

1. **SoFi Bank, N.A. unadjusted past-due / charge-off / reserve rates** (RSSD 962966), 2024Q1 → latest. The one series immune to the pre-charge-off loan-sale exclusion. **Drainable now** (public regulatory filings). Neither bench ran it; this blocks gate (ii).
2. **Q3-26 Technology-Platform contribution profit.** Not drainable until the print. Estimate: **\$10–14M**, from the Q2 actual \$11.8M plus the observed sequential inflection (+13% revenue, +2M accounts) minus continued client-exit drag; probability it exceeds the \$15M gate ≈ 0.35 .
3. **Our own differentiated Q3 revenue/EPS number, with a stated mechanism.** We have none — this is the surviving edge failure from both benches. Estimate against consensus \$0.17 / \$1.26B: **\$0.16–0.19 EPS on \$1.24–1.29B**, i.e. no gap; probability our number differs from consensus by more than one cent in a defensible way ≈ 0.25 .
4. **Q3 fair-value note: direction of the weighted-average default assumption and discount rate.** Not drainable until the 10-Q (~2026-11-05). Estimate: default assumption **up 0–15bps**, discount rate tracking the benchmark; probability both rise together (the stand-down trigger) ≈ 0.30 .
5. **Options chain: chain-level midpoint implied volatility, November strikes, realized-volatility series, implied-volatility percentile.** **Drainable now** via the broker gateway. Blocks the entire expression recommendation above.
6. **Confirmed Q3 earnings date.** Three vendors, three dates (10/26, 10/27, 10/28–29); no 8-K or press release. Not drainable now — the company has not announced. Estimate: **2026-10-26 to 2026-10-29**, probability the date is 10/27 ≈ 0.55 .
7. **Current short interest and days-to-cover.** Our file is a February-2026 vintage. **Drainable now** (semi-monthly exchange data). Estimate if unavailable: **100–135M shares, 8–11.5% of float**, 3.5–4.5 days to cover, based on the last known 133.3M against unchanged ~30.4M-share daily volume.
8. **The H2 profit bridge:** ~\$900M of EBITDA needed in the second half to hold ~\$1.6B, and a Q4 of roughly \$0.23 to hold \$0.60. Not drainable pre-print; no data check resolves it (both benches agreed). Estimate: probability the \$0.60 guide is reaffirmed at the Q3 print ≈ 0.55 .
9. **Loan-platform/fee share of Q3 originations.** Not drainable until the print. Estimate: **\$3.0–4.0B of ~\$15–16B**, i.e. 19–25%, extrapolating the \$3.1B of \$14.8B in Q2; probability the share rises ≈ 0.50 .
10. **The 22% tax-rate / “700bps above original” claim as stated in the transcript, versus the 8-K guide language.** Never diffed. **Drainable now** (the 2026-07-29 8-K and its exhibit are in the filing record).
11. **Consumer-demand proxies versus the $\geq 30\%$ member-growth guide** (dated app-store reviews, search/social trend series). **Drainable now** with a feed we do not currently pull. Estimate meanwhile: member growth **28–34% year over year**, from deposits +\$5.3B in-quarter and no deposit-flight signature.

Primary source relied on throughout for credit, segment, fair-value and equity facts: the Q2-26 10-Q, <https://www.sec.gov/Archives/edgar/data/0001818874/000181887426000054/sofi-20260630.htm> (filed 2026-08-06), with the prior quarter at

<https://www.sec.gov/Archives/edgar/data/0001818874/000181887426000037/sofi-20260331.htm>.

Where transcripts and the filing disagree, the filing wins.

ADJUDICATION — 2026-09-16 15:37Z

Fair-value book is the wrong instrument for NCO/DQ (marks down on discount rate + default assumptions); Tech Platform contribution unproven. Do not pay 2.44x TBV for a re-rate.

REOPEN GATES: <\$16.50 AND Q3 Tech Platform contribution profit >\$15M AND SoFi Bank call-report past-dues (RSSD 962966) AND LPB fee mix → 1/4 starter
