

PITCH — TBBK — VERDICT

ADJUDICATED 2026-09-16 — WATCH — band \$40 (conviction 7/10). The court found nothing to own at this price; the reopen gates below are the only path back.

What we believe

1. **The franchise was already shrinking before the counterparty event.** Book value per share went \$18.60 (6/30/25) → \$16.29 (12/31/25) → \$17.19 (6/30/26) while EPS “grew” 14.2% — because the share count fell from 47.2M to 41.043M, with 870,129 shares bought in Q2’26 at an average \$57.46 versus \$17.19 of book (3.3x). That last mark is ~14% underwater today. Net income was up about 1.3–1.5% y/y. That is EPS manufactured by the divisor, not by the business. Primary: 2Q26 8-K ex-99.1, <https://www.sec.gov/Archives/edgar/data/0001295401/000162828026051050/tbbk-20260730xexx991.htm>
2. **Net interest margin fell 4.44% → 3.85% (–59bp)**, which management attributes to shifting into fintech loans “for which we primarily earn fee income.” So the fee stream now sitting at counterparty risk is the same stream that *replaced* spread income. The two exposures compound; they do not offset. This is the single strongest fundamental leg in the whole file and our red bench missed it.
3. **The exposure is two-legged, not one-legged.** If Chime moves its banking to its own charter, TBBK loses program fees *and* a large block of cheap deposits (average interest-bearing liabilities \$8.94B at 1.86% per the 10-Q). A fees-only model understates the hit by roughly 2x. Chime has publicly guided to “>\$100M net synergies, driven by sponsor bank fee savings” — the synergy only exists if the fees stop (<https://www.chime.com/newsroom/chime-announces-agreement-to-acquire-stride-bank/>).
4. **Capital is thinning into the exact event that would demand capital.** Average equity fell \$845M → \$701M (–17%) against \$9.70B average assets (10-Q, <https://www.sec.gov/Archives/edgar/data/0001295401/000162828026054157/tbbk-20260630.htm>). The buyback that flatters EPS and the balance sheet that would have to absorb a deposit-replacement event are drawing on the same pot.
5. **But the headline bear kill is wrong.** The “revenue –9.8%” line is an accounting artifact: credit-enhancement income fell \$43.2M → \$25.8M and the 10-Q states the paired provision fell \$17.4M with “no related net impact.” Excluding that pass-through, non-interest income *rose* 16.7% to \$47.3M. Anyone shorting this on “revenue contraction” is shorting a gross-up.
6. **Therefore: not a healthy compounder that overshot, and not a fraud.** It is a shrinking, buyback-flattered, ~91%-rented deposit book at ~2.88x book (\$49.48/\$17.19), whose largest tenant has publicly monetized the option to leave. That is a name to own at a price, and the price is lower than here.

What the market believes

- **Consensus bull view (still the sell-side default):** FY27 EPS \$8.10–8.30 → ~6.0x forward, 34.7% ROE, “best-in-class BaaS platform,” savings of “>\$20M annualized” cushioning the loss, and Chime too small/too switching-cost-bound to leave quickly.
- **What the tape actually says:** \$81.65 high → \$64.41 pre-event → \$49.48 now. Pre-event the stock was already ~21% off its high. This is leg two of an eleven-month de-rate, and there was no reflex bounce in the two sessions after 9/8. The market has already voted that something structural changed; it has *not* yet voted on whether 2.88x book is the right multiple for a rented deposit franchise.
- **The wire narrative:** Stride Bank sold at ~1.5x tangible book for \$590M (<https://www.bankingdive.com/news/chime-buys-stride-bank-590m-acquisition-fintech/829857/>). That 1.5x line ran everywhere. It is consensus, not insight — and it is arguably the wrong comp (a \$5.4B community charter bought *for the charter* is not a 34.7%-ROE fee platform).
- **The gap:** nobody, including us, has produced a post-9/8 street FY27 EPS number. There is no external anchor in this file. That is the binding research gap, and we say so rather than pretend our own \$6.50–7.50 estimate is a consensus.

Why we might have edge

1. **We priced the funding leg; most models price only fees.** At a 25% Chime share, fees ~\$41M plus ~\$2.1B of deposits replaced at roughly +2.5pt of spread ≈ \$53M → ~\$94M pre-tax ≈ **\$1.70/share after tax on 41.0M shares**. The market’s 21.6% drawdown on the event is almost exactly that number. So we can say something precise: *the tape is at the central case, not an overshoot* — which means the asymmetry is no longer on the bull side at this price.
2. **We caught the pass-through artifact.** Two of our own kill legs were built on a revenue decline that the issuer’s own MD&A neutralizes. Anyone who did not read the provision pairing is mis-modeling this name in *both* directions.
3. **We read the pack’s primary document instead of the press narrative.** The 9/4 8-K says the *new* increment is ~\$14M, and the balance of the “>\$20M” is the Q4’25 Institutional Banking reorg already in run-rate and already inside the April-2026 guide. $\$14\text{M}/41.043\text{M} = \0.34 **pre-tax, ~\$0.27 after tax** — about 3% of the guide, and unnetted against the revenue lost by exiting SBL origination entirely by end-2026.
4. **Counterparty-side sizing exists and almost nobody pulls it.** Chime’s own S-1/10-Q disclosures and the FDIC call reports for Stride Bank N.A. and Bancorp Bank N.A. bracket the ratio from the other side of the trade. We have identified the pull; we have not yet made it. That is a queued edge, not a realized one.
5. **We have a disciplined disconfirmation set.** We know the four things that would flip this to a buy, and three of them are public documents on dates we can wait for.

Why it might be priced in

- The stock is down 39% from its high and 21.6% on the event itself. The bear case is not a secret.
- The \$1.70/share figure we are proud of *equals* the drop. By our own arithmetic, the central case is in the price. Our edge is therefore not “the market is wrong about Chime”; it is only “the multiple can compress further and the pre-existing trend is worse than advertised.” That is a thinner claim.
- The 1.5x-book comp is in every wire story. If that were the operative anchor, the stock would already be at \$26.
- Our tape stamp is barely 2.2% off the 52-week low. Being early to a de-rate that is 39% complete is not obviously edge.
- **Symmetric concession:** if Chime is genuinely ~10% of fintech fees, and the FY27 guide is reaffirmed with attrition inside it, then a 6x multiple on a 34.7%-ROE fee platform is a mistake and this thing round-trips to \$65+ without us. We have no evidence today that rules that out. See failure narrative #1.

What could go wrong

FAILURE #1 — “The artifact doctrine ate the trade” (omission failure; monitorable). We proved the revenue kill was a gross-up. We then let that finding do too much work and stayed flat while the actual outcome was benign: Chime turns out to be ~10% of fees, the Cash App program ramps, TBBK reaffirms \$8.10–8.30, and the stock is \$70 by mid-2027. The specific mechanism of failure is our gate design: we require an *explicit* post-9/8 reaffirm, and companies almost never issue explicit standalone reaffirms — they simply repeat the guide in a deck. Under our own “unchanged ≠ confirmed” boilerplate rule, that repetition doesn’t trip the gate, so the gate is close to unsatisfiable and we are structurally short the recovery. *Tripwires (armed as gates below):* 8-K Item 8.01 quantifying Chime; conference/PR guide language; price gate at \$55; CHYM 10-Q account split.

FAILURE #2 — Non-public repricing (NO MONITORABLE TRIPWIRE). Unknown-unknown class: **SUPERVISORY / CONTRACT OPACITY — non-public regulator correspondence and NDA-gated counterparty economics.** Two versions, same class. (a) An informal agreement, MRA, or consent order is under negotiation with the OCC over BaaS oversight; it is invisible until it lands as a single 8-K, and sector precedent (multiple BaaS sponsor banks over the last three years) is that these arrive with no public precursor, then cap growth, force capital build, and *stop the buyback* — which is the load-bearing input for the EPS guide. (b) TBBK and Chime privately renegotiate program economics — fee reset, deposit-sweep unwind, or an exclusivity/wind-down schedule — under an NDA, and we learn the terms from a 10-Q footnote after the price has moved. There is no filing, no tape, no connector, and no alt-data series that reads either one in advance. Nothing in our sensor list touches it. We are stating this plainly rather than inventing a proxy: **this risk is unhedged and unmonitorable, and it is the reason position size is capped at 3% of book even at our best price.**

FAILURE #3 — Reflexive/structural: we are a passenger to a bid that can disappear. - *Our own size vs ADV*: estimated ADV is 0.7–1.1M shares (~\$35–55M/day; **not in the pack — see unverified #5**). A ⅓ starter at 1.0% of book is on the order of a few tens of thousands of shares — well under half a day’s volume. **We are not the reflexivity here.** Our entry and exit are not price-moving in normal tape. - *The predicted flow that is*: TBBK retired 870,129 shares in one quarter — about 2.1% of shares outstanding, ~13.8k shares/day, roughly 1.5% of estimated ADV. Small daily, enormous cumulatively: ~8%/year of float. That price-insensitive buyer is what has been absorbing the de-rate. Average equity is down 17%. If capital ratios or a supervisory action bind, the buyback stops — and it stops at the *same moment* the deposit-replacement need appears. Then we lose the marginal bid, the EPS bridge, and the capital cushion in one print. Float has also shrunk ~22% in a year, which makes any index/passive rebalance or 13G-holder exit disproportionately violent in both directions. - *The real liquidity risk is correlated exit, not our size*: every holder’s trigger is the same document (an 8-K quantifying Chime). On that day ADV is meaningless — the whole book tries to leave through one door. - *Doctrine interactions*: (i) blue’s new passthrough_gross_up_revenue_artifact detector is calibrated on exactly one observation and, if left as-is, will suppress a *genuine* revenue kill next quarter; (ii) red’s buyback_flattered_eps_at_premium_to_book candidate fires on “revenue decline,” which means it would have **false-fired here** — it must be amended to exclude pass-through lines before we let it gate anything; (iii) our prize table is anchor-and-adjust off two anchors — the pre-event \$64.41 and the 1.5x-book Stride comp — and blue has already ruled the second one a category error, so our EV of \$43.75 inherits anchoring bias in both directions and should not be treated as precision.

Filled in, one line: we lose money because we buy the price-gate at ~\$40 on the view that Chime is the whole story, and the actual loss comes from a non-public capital or supervisory constraint that stops the buyback and forces a raise below book.

If this position loses money, the most likely reason will be ____

PROPOSED ENTRY BANDS

No entry today. Both benches independently landed FLAT; the deck concurs. Reopen bands below, taken from the benches' own arithmetic.

Reopen Band A — disclosure-gated (fires on a document, not a price). - Trigger: TBBK 8-K/Item 8.01 (or Q3 print) putting Chime at **<15% of fintech fee income AND <15% of average deposits**, with a signed post-close continuation arrangement. - Action: $\frac{1}{3}$ **starter = 1.0% of book**, up to **\$55.00** limit. If it gaps above \$55, no chase — the disclosure is worth ~\$10/share of the fork and above \$55 we have paid for it.

Reopen Band B — price-gated (fires without any new disclosure). - **≤\$40.05** (= 2.33x \$17.19 book) **AND** an FY27 guide reaffirm dated after 9/8/26 → $\frac{1}{3}$ **starter, 1.0% of book.** - **≤\$34.38** (= 2.00x book) → **add $\frac{1}{3}$, +1.0%** — no reaffirm required at this price; the multiple is doing the work. - **≤\$25.79** (= 1.50x book, the Stride transaction comp itself) → **final $\frac{1}{3}$, +1.0%. Max position 3.0% of book**, capped by Failure #2 (unmonitorable supervisory/contract risk).

Reopen Band C — counterparty-data-gated. - Trigger: an FDIC call-report pull (Stride Bank N.A. + Bancorp Bank N.A.) or a CHYM 10-Q sizing Chime-attributable balances such that TBBK's exposure lands **below 15%**. Same terms as Band A.

Pre-committed trims/exits (defined now, before we own it, so they are not renegotiated later). - **Cut half** on any of: BVPS prints another y/y decline while repurchases continue above 2.5x book; buyback suspended or authorization exhausted without a stated capital reason; any non-public-turned-public regulatory agreement. - **Full exit** below **\$22.00** (~1.28x book) — at that point the market is pricing a capital raise below book and our thesis frame is wrong, not early. - **Trim** 1/3 into any move above **\$62** absent a Chime resolution — that is the pre-event price with the exposure still unquantified.

Sizing summary: 0.0% today → 1.0% per gate → 3.0% maximum. Our size is <0.5x estimated daily volume at every tranche, so execution is not the constraint; the constraint is the unmonitorable tail.

Catalyst dates. | Date | Event | Confirmed? | | — | — | — | | 2026-10-29 | Q3'26 print — **PRINT**
PROXIMITY: ~34 trading days out, NOT within 5. Date is yfinance-derived, **UNCONFIRMED**; no company PR located naming it. Item 8.01 quantifying Chime. This is the race condition. It is the highest-information event in the file and it has no date | **N/A** |

ARMED SENSORS

(armed provisionally with this deck; session adjudication ratifies)

- price alert: fires below 22.0 (deck-provisional: Structural exit: market pricing a capital raise below book means the frame is wrong, not early.)
- filing watch: 8-K until 2027-03-09 (deck-provisional: Item 8.01 quantifying Chime as a share of fintech fees and deposits — the highest-information undated)
- dated pack TBBK|2026-10-29: TBBK: Q3'26 earnings print — yfinance-derived, no company PR located naming it; ~34 trading days out, NOT within 5. (date confirmed=False)
- dated pack TBBK|2026-11-10: TBBK: Estimated CHYM 10-Q — counterparty-side account split. (date confirmed=False)
- dated pack TBBK|2026-11-30: TBBK: Estimated availability of FDIC call reports for the 9/30/26 quarter (Stride N.A. + Bancorp Bank N.A.). (date confirmed=False)
- dated pack TBBK|2026-12-31: TBBK: SBL loan origination discontinued per the 9/4/26 8-K Item 2.05. (date confirmed=True)

- dated pack TBBK|2027-06-30: TBBK: Expected Chime/Stride close (1H27) — the actual fee-cliff date. (date confirmed=False)

What remains unverified

1. **Chime's share of TBBK fintech fee income and of average deposits — the pivotal ratio.** Not drainable now. Estimate: **20–30% of fintech fees; 15–30% of average deposits**, $p \approx 0.60$ that the true value falls in those bands. Basis: TBBK deposits are ~91% Fintech Solutions with Chime the largest program; Chime's own >\$100M synergy guide implies a fee base of that order across both sponsors.
2. **Whether a post-close TBBK–Chime continuation arrangement exists (spread-only / sweep destination).** Not drainable now (private contract). Estimate: **$p \approx 0.55$** that some residual sweep or spread relationship persists ≥ 12 months past close. Basis: Stride at ~\$5.4B assets plus TBBK-held Chime balances breaches the \$10B Durbin threshold, so migration is sweep-capacity-gated.
3. **Post-9/8 street FY27 EPS consensus.** Drainable now. Estimate: **\$6.50–7.50** vs the un-reaffirmed \$8.10–8.30 guide, $p \approx 0.55$. Basis: applying a 20–25% haircut for the Chime fee leg to the guide midpoint.
4. **Options-chain reality: chain-level midpoint IV for the candidate strikes, realized vol, IV percentile.** Drainable now. Estimate: **IV 45–60%, RV20 ~50%**, $p \approx 0.5$. Basis: post-event single-name financial with a binary counterparty overhang. **We deliberately did not use an underlying aggregate IV feed (the TSSI 71-vs-101 lesson).**
5. **ADV and our size-vs-ADV ratio.** Drainable now. Estimate: **0.7–1.1M shares/day (~\$35–55M)**, $p \approx 0.6$. Basis: \$2.0B cap, 41.0M shares, elevated post-event turnover.
6. **Form 144 (8/6/26) filer identity and share count; Form 4 counterparties.** Drainable now by direct EDGAR document fetch — both benches marked this UNCHECKABLE, which was a *tooling* limit, not a data limit. Estimate: **10k–60k shares, ordinary plan sale**, $p \approx 0.65$. Basis: base rate for insider 144s filed on a 10-Q date at a \$2B bank.
7. **Q3'26 earnings date.** Not confirmable until a company PR. Estimate: **2026-10-29 ± 2 trading days**, $p \approx 0.70$. Basis: prior-year Q3 released 10/30/25.
8. **SBL portfolio balances and runoff credit marks (revenue lost by the exit, which no bench netted).** Not drainable until the Q3 10-Q. Estimate: **\$0.6–0.9B balances, ~\$30–45M of annual revenue foregone**, $p \approx 0.5$. Basis: SBA 7(a)/sponsor-lender comps at similar-sized platforms; this partially or wholly cancels the \$14M savings.
9. **Remaining buyback authorization and the capital ratios that bind it.** Partially drainable from the Q3 10-Q/XBRL. Estimate: **\$100–150M remaining**, $p \approx 0.5$. Basis: pace of ~\$50M/quarter against average equity down 17%.
10. **Chime member-growth trend (the deposit-base driver at both sponsors).** Not drainable now — no connector run. Estimate: **+15–25% y/y member growth**, $p \approx 0.50$. Basis: pre-IPO disclosed growth rates decayed on a standard S-curve base rate.

PRIZE TABLE + VOL READ

Required here because item #1 is both private and time-gated: the pivotal ratio resolves only on a company disclosure or a call-report release. **Our blue bench declared “PRIZE TABLE: N/A” on the grounds that TBBK is not a pre-revenue developer — that is the wrong test and we are overriding it.**

Anchor-and-adjust: anchor is the pre-event **\$64.41**; adjustments are the book-value ladder (\$17.19 × multiple).

Scenario	Mechanism	Prob	Price	p × price
Ratio small + reaffirm	Chime <15% of fees and deposits; FY27 guide reaffirmed post-9/8; Cash App ramps	0.15	\$65.00	\$9.75
Gated migration / spread-only persistence	Stride’s \$10B cap forces staged migration; TBBK persists as a spread-only destination; NIM keeps sliding	0.35	\$52.00	\$18.20
Full in-housing, de-rate to ~2.0x book	Fees stop at close; deposits replaced at wholesale; multiple compresses	0.35	\$34.38	\$11.90
In-housing + capital/supervisory event	Buyback stops, capital build or raise near book; 1.5x-book comp applied	0.15	\$25.79	\$3.90

EV = \$43.75 versus spot \$49.48 → –11.6%. The expected value is below the market price. That is the arithmetic reason for no starter, and it is independent of either bench’s rhetoric.

$\sigma_{\text{table}} = \$13.12 = 26.5\%$ of spot over the horizon to resolution. Annualized: **37.5%** at T=0.5yr, **40.9%** at T=0.42yr (a ~Feb-2027 expiry).

Expression math, priced off the table itself ($C_{\text{ours}} = \sum p_i \times \max(S_i - K, 0)$, undiscounted):

Strike	C_ours (table-implied)	Chain mid	Verdict
\$45	\$5.45	not pulled	cannot compare
\$50	\$2.95	not pulled	cannot compare
\$55	\$1.50	not pulled	cannot compare
\$60	\$0.75	not pulled	cannot compare

VRP = IV – RV = NOT COMPUTABLE. A listed chain exists (TBBK, Nasdaq Global Select), but **no chain-level midpoint IV and no real strike quotes are in the evidence pack, and no options connector was run** — this is unverified item #4. The mandate requires chain-level midpoint IV and

real quotes for candidate strikes, never the underlying aggregate IV feed. We refuse to substitute the aggregate feed: they diverge, sometimes grossly (the TSSI 71-vs-101 lesson), and a fabricated VRP would silently drive the instrument choice.

Bimodality note: the table is fork-dated on a single binary — the Chime ratio disclosure. Mass sits at \$65 and at \$34/\$26 with a thin middle. A lognormal chain will therefore misprice both wings; if and when we pull quotes, the specific test is whether the \$55 call trades under our \$1.50 and the \$35 put under its table-implied value. If both are cheap, the fork is not priced and a strangle/call-spread expression becomes live. We do not know that yet.

Instrument recommendation — the OUTPUT of the arithmetic above: NONE. The derivation, shown: (a) table EV is **11.6% below spot**, so long stock at \$49.48 is negative-EV on our own numbers; (b) call value requires a VRP comparison we cannot make without chain quotes, so any long-call sizing would be guesswork dressed as math; (c) covered calls require stock we do not own; (d) cash-secured puts at the \$40.05 gate are the *structurally* correct expression — they get paid to wait at the level we want — but pricing them needs the same chain quotes we lack, and premium-selling gates require rich IV to be *demonstrated*, not assumed. **Instrument: none today.** **Re-run this block the moment item #4 is drained; if IV proves rich at the \$40 strike, the Band-B starter routes to a CSP rather than a limit order.**

TAX overlay. The loss branch must land in the intended tax year. The resolution path is dated 1H27 (Chime/Stride close), so any option expressing this view carries a 2027 expiry — which **defers the loss branch past Dec 31 and is therefore excluded during a harvest year unless the edge numerically dominates.** Here the edge does not dominate: EV is *negative* at spot, and the VRP is unknown. **Ruling: no 2027-dated option expression in a harvest year.** If we take the Band-B starter, take it in common stock, where a loss is harvestable in the year it is realized. If 2026 is not a harvest year, this constraint releases and a Feb-2027 CSP at \$40 becomes the preferred vehicle — conditional on the chain pull.
