

VNCE pitch deck

PITCH — VNCE — VERDICT

PROPOSED — PENDING ADJUDICATION — Take a token starter now ($\leq \$35k$ / $\sim 0.15\%$ of book) at $\sim \$4.96$ under the already-tripped legacy price alert, with the real decision deferred to the Q2 FY26 10-Q landing this week; full starter to $\leq 0.4\%$ only if the redacted royalty minimum is $\leq \$3M/yr$ and H1 cash flow is positive ex-refund.

What we believe

Vince Holding is a $\sim \$64M$ market-cap apparel company (12.85M shares at the pack print of $\$4.96$) that just did three things at once, and the market has only priced one of them.

- 1. The Q2 print was mostly a tariff refund, and we accept that.** Adjusted operating income of $\$16.4M$ versus $\$5.5M$ last year contained a **$\$10.4M$ IEEPA tariff-refund benefit** ($\$7.2M$ wholesale, $\$3.2M$ direct-to-consumer). Strip it and you get roughly **$\$6.0M$ versus $\$5.5M$ on 11.7% more sales** — an ex-refund adjusted operating margin of $\sim 7.3\%$ against 7.5% last year. There is no operating leverage in this business. We do not capitalize $\$1.02$ of adjusted EPS or a 20% margin. Primary source: https://www.sec.gov/Archives/edgar/data/0001579157/000119312526387188/vnce-ex99_1.htm
- 2. The balance sheet quietly got much better, and almost nobody said so.** Borrowings fell to **$\$12.3M$ from $\$31.1M$** a year ago; excess availability rose to **$\$63.6M$ from $\$42.6M$** . Inventory **fell** to $\$73.4M$ from $\$76.7M$. The at-the-market equity program sold **zero** shares in the quarter with only $\$0.9M$ left on it. Every “the balance sheet is deteriorating” leg in the original brief is factually backwards.
- 3. The structure changed in a way that is not yet quantified anywhere.** On 8/27/26 VNCE bought the OVO (October’s Very Own) operating companies for **$\$3.00$ total** while Authentic Brands paid **$\$117,647,058.82$** for the intellectual property; VNCE kept 5% of the IP subsidiary and took a worldwide exclusive apparel license at “a single digit percentage” on retail/e-com and “ten percent (10%) or lower” on wholesale. **The annual guaranteed minimum royalty is redacted.** The deal was funded by amending the existing asset-based loan, not with new capital. Primary source: <https://www.sec.gov/Archives/edgar/data/1579157/000119312526369683/vnce-20260827.htm>

So our belief is narrow and cheap: at $\sim 5.0x$ enterprise value to FY25 adjusted EBITDA ($\$15.1M$), we are being asked to pay very little for a de-levered balance sheet plus a $\sim \$50M$ -sales brand with a stated path to $\$100M+$ sales and $\$10$ – $\$12M$ of EBITDA by FY2030 — while the one number that could break it (the guaranteed minimum) is hidden behind a redaction that resolves in days, not months. That is a bounded, dated, small-size bet on a disclosure event.

What the market believes

The tape took the stock down roughly 17% intraday on print day and closed near -24% from the ~\$6.74 pre-print level, into a pack print of \$4.96 — **against a raised full-year guide and a \$0.76 headline EPS beat**. The marginal holder appears to believe: (a) the beat is fake because it is a refund, (b) the Q3 Vince-only guide of +5-8% is a step down from +11.7% and *still* leans on ~\$2.6M more refunds, and (c) OVO is a cost and a distraction — management itself calls it earnings-neutral in FY26.

The market is right on (a). It is probably wrong on (b) in two-year-stack terms: H2 FY25 grew +5.4% against H1 declines of -2%, so Q3 laps the hardest comp of the year; +5-8% on that lap is not deceleration. And on (c), nobody has published a number for the brand at all.

Why we might have edge

- **The sell-off cannot be discovery.** On 8/27 — ten trading days before the print — the company stated in the OVO release that Q2 would land at the high end of prior guidance **excluding any benefit from tariff refunds** (<https://www.businesswire.com/news/home/20260827526062/en/>). The “the beat was one-off” fact was public before the print. So the -24% is either structural (the redacted minimum, OVO reinvestment) or it is positioning exhaustion in a stock that had run enormously off its \$1.95 low. Knowing which one it is is the trade, and neither bench answered it.
- **The binding document lands this week, not in December.** VNCE files its 10-Q the same day as its results 8-K (Q1: 8-K 0001193125-26-271795 and 10-Q 0001193125-26-271897, both 6/16/26). The 9/10/26 8-K arrived with **no companion 10-Q**, and the statutory due date for a period ended 8/1/26 is ~9/15/26. That document carries purchase accounting for OVO, the assumed liabilities, the ABL Third Amendment, H1 operating cash flow, possibly the license exhibit. The red bench gated its entire reopen on a December filing and never checked the clock.
- **The redaction is itself the signal.** A guaranteed minimum a licensee can comfortably cover is usually disclosed. One that is redacted is more often one that is uncomfortable, escalating, or tied to the \$100M-by-FY2030 target rather than to today’s \$50M. We are structuring size around that asymmetry rather than assuming it away.
- **Nobody has valued the asset we are paying royalties on.** The bear case litigated the royalty cost in detail and never once priced OVO’s \$10-12M of target EBITDA against a \$64M market cap.

Why it might be priced in

Honestly: most of it probably is.

- The refund-loaded quarter, the flat ex-refund margin, and the Q3 step-down are all in the press release the whole market read. Our kill on the print is **consensus-class and already transacted** — a -24% day is not a market that missed it.

- The balance-sheet improvement is also in the same release. It is not proprietary; it is merely under-discussed in a name with essentially no coverage.
- +154% off the 52-week low is not a dislocation. A 39.5% drawdown from an \$8.20 high in a stock that tripled is a retracement in a winner, and “cheap versus the high” is the weakest form of cheap.
- The OVO prize is a FY2030 number from management, on a brand that just sold its IP to a licensing firm. Brand-management transactions frequently mark the *top* of a brand’s cultural arc, not the base of a growth ramp. Paying \$3.00 for the opcos means the seller thought the operating business was worth approximately nothing.
- We cannot verify OVO demand direction at all. Both benches’ consumer detectors came back UNCHECKABLE (baseline-zero heat feed, bot-walled retail channel). We are long a consumer trend we cannot measure.

What could go wrong

Failure narrative 1 — The redacted minimum is bigger than either bench modeled, because a minimum is not a rate. Both benches sized the royalty by multiplying a rate band by today’s ~\$50M of OVO sales and got \$2.5–5.0M/yr. That is an arithmetic error of kind, not of degree: a *guaranteed minimum* in a brand license is typically a floor keyed to the licensor’s growth expectations — here, an explicit \$100M+ target by FY2030 — and it usually escalates on a schedule. A minimum that starts at \$4M and steps to \$8–10M by FY29 is entirely ordinary structure and would exceed half of group FY25 adjusted EBITDA as a *fixed* charge in the years the equity is supposed to re-rate. Tripwire: the 10-Q purchase-accounting and commitments notes. Monitorable.

Failure narrative 2 — The refund faucet closes and there is nothing behind it. Q2 carried \$10.4M; Q3 guidance carries another ~\$2.6M. Ex-refund the business earns ~\$6M a quarter of adjusted operating income against a roughly \$76M enterprise value, before any royalty. If the refund stream ends and the core simply holds flat while OVO consumes working capital, FY27 EBITDA lands near \$12–15M and the stock is fairly valued at \$4, not cheap. Tripwire: the tariff-refund line item in the Q3 release; monitorable but coarse.

Failure narrative 3 — NO MONITORABLE TRIPWIRE: the brand goes cold. OVO is a culture-dependent label whose equity is tied to a single artist’s public standing. The thing that kills it is not a filing, a covenant, or a comp — it is a reputational event, a cultural rotation, or a slow fade in relevance that shows up in the P&L four to six quarters after it shows up in the culture. We have **no instrument** for this: `consumer_product_heat` returned BASELINE_ZERO with heat, rank, and social all null; `consumer_product_reviews` returned a bot wall on the retail channel and a baseline-only cohort delta; `app_review_velocity` has no first-party SKU to poll. There is no price, filing, or dated disclosure that fires before the damage is done. **Unknown-unknown class: celebrity/culture-linked intangible impairment — a reputational-beta exposure with no financial-statement leading indicator and no public telemetry we can lawfully or technically acquire.** We name it because we cannot sense it, and size accordingly.

The reflexive / structural leg. P180 owns ~7.22M of 12.85M shares, leaving a float of roughly **4.4M shares (~\$22M)**. Our own ADV estimate is unverified — call it 200–400k shares on a normal day, several multiples of that in the week after a print. A \$35k starter is ~7,000 shares: under 4% of a normal day, invisible. A full 0.4% sleeve on a \$25M book is ~\$100k, ~20,000 shares, still under 10% of ADV *if* our ADV estimate is right — and that estimate is the single most fragile number in this deck, because in a 4.4M-share float the bid can vanish entirely on a quiet day and our exit becomes a multi-day event exactly when we most want a single-day one. Predicted flow is adverse in one specific way: any P180 or insider sale into this float moves the stock more than the news it represents, and any positive re-rating draws momentum flow into a float too small to absorb it, which means the upside branch overshoots and the downside branch gaps. Doctrine interaction: our consensus-kill rule pushes toward a starter precisely *because* the bear case is public, while our thin-float rule pushes toward zero — the resolution is that the position is capped by liquidity before it is capped by conviction, and the legacy price sensor (below) independently caps it at speculative-tag size. Every one of those constraints binds at a smaller number than our thesis would justify. That is the correct outcome and we are not overriding it.

If this position loses money, the most likely reason will be ____ that the redacted guaranteed minimum royalty turns out to be a large, escalating fixed charge on an earnings base that never had operating leverage once the tariff refunds stopped.

What we checked ourselves

Claim	How checked	Found	Confirmed?
Q2 adj. op income \$16.4M is a real turn	8-K Ex-99.1 9/10/26 (primary)	\$10.4M of it is an IEEPA tariff refund; ex-refund ~\$6.0M vs \$5.5M LY on +11.7% sales	REFUTED — do not capitalize the print
Ex-refund quarter still missed plan	Q1 call guide (adj op margin 6.5–7.0%) vs computed 7.3% ex- refund	Above plan, slightly below LY's 7.5%	CONFIRMED the beat-vs-guide; ~20bp YoY deleverage stands
The release names an Employee Retention Credit as a FY26 windfall	8-K Ex-99.1	The \$5.6M ERC is prior-year ; FY26 SG&A rose from anniversarying it. Our own brief had this backwards. Blue further narrowed it: ERC is excluded from both years' <i>adjusted</i> figures, so it is a GAAP-only effect, not an adjusted headwind	BENCH ERROR (ours), corrected twice
Inventory building: \$70.8M vs \$62.3M	8-K Ex-99.1	\$73.4M at 8/1/26 vs \$76.7M LY — a decrease . Our brief quoted the Q1 (5/2/26) column	BENCH ERROR (ours) — REFUTED
Dilution via the Virtu ATM	8-K Ex-99.1	Zero shares sold in Q2; \$0.9M capacity remains	REFUTED
Net debt building (\$29.1M / \$31.2M)	Same-quarter comparator + 9/10 release	\$12.3M borrowings / \$63.6M availability at 8/1/26 vs \$31.1M / \$42.6M LY. Red called this “not retrievable in this environment” while the number was in the release it was already citing — under-called its own cut	BENCH ERROR (red) — REFUTED, upgraded to confirmed refutation

Claim	How checked	Found	Confirmed?
\$3.00 opco price implies a negative-equity shell	8-K 8/27/26	IP proceeds were used to strengthen the opco balance sheet before transfer; ~\$50M CY25 sales; management guides earnings-neutral FY26, accretive FY27	REFUTED as stated
Royalty ceiling $\approx$ \$5M/yr	License summary in 8-K 8/27/26	Red applied the $\leq 10\%$ wholesale rate to a base that is today 12 doors + e-com with wholesale not launching until H2 FY27; the applicable band is the single-digit retail rate $\rightarrow$ ~\$2.5–4.0M run-rate	BENCH ERROR (red) — REDUCED
...but the run-rate royalty bounds the minimum	Our own review of both benches	It does not. Both benches derived a guaranteed minimum from rate $\times$ current sales. A minimum is a contractual floor, commonly escalating toward the licensor's growth target (\$100M+ by FY2030). Both benches share this error; it is now Failure Narrative 1	BENCH ERROR (both) — reopened as the load-bearing unknown
Q3 +5–8% guide = deceleration	Two-year stack from pack XBRL + FY25 totals	FY24 \$293.5M, H2 FY24 \$160.2M, H2 FY25 \$168.8M (+5.4%) vs H1 FY25 – 2.1%/–1.3%: Q3 laps the hardest comp of the year	REDUCED to neutral — red's seasonality tool was unavailable and it flagged the gap; the gap was load-bearing
The tape is unverifiable; rails disagree $\pm 50\%$	Pack triangulation	\$5.14/\$8.20 = –37.3% ✓ and \$5.14/\$1.95 = +163.6% ✓ against the then-pack; TradingView's \$86.59M cap $\div$ 12.846578M sh = \$6.74 = the pre-print close. Rails timestamp differently; investing.com's 2.50 is stale	BENCH ERROR (red) — OVERTURNED. Red's "\$4.00 tripwire rests on an unverified band" cut fails
...but blue's tape is also not current	Pack of record (2026-09-10T21:09Z)	Pack governs at \$4.9599 , dd52 –39.5%, +154.4% off low. Blue argued from \$5.14 and imported a "+365% one-year" figure from a secondary rail that the pack cannot reproduce. Direction agreed; magnitude unverified	BENCH ERROR (blue) — we use pack numbers only
The beat is the refund	Consensus adj. EPS \$0.26 vs actual \$1.02; \$10.4M after tax on ~13.1M shares $\approx$ \$0.76	Arithmetic holds — the entire beat is the refund	CONFIRMED
...and that explains the – 24%	8/27 pre-announcement	It cannot. The ex-refund quality was public 10 trading days early and guidance was raised. The drawdown is unexplained; that is the open question	CONFIRMED that the standard explanation fails
Print proximity: nothing until December	Filing-cadence check (Q1 8-K and 10-Q both filed 6/16/26)	9/10 8-K has no companion 10-Q $\rightarrow$ Q2 10-Q due ~9/15/26, this week	BENCH ERROR (red) — OVERTURNED
Float ~4.4M shares	Pack + P180 65% disclosure	Directionally right; exact current float not pulled (no DEF 14A beneficial table)	PARTIAL — sizing constraint, not thesis
Detector atlas complete	Cross-check of both benches' lists	Red omitted two dispatched entries (chinese_smallcap_ramp_dump_archetype, clinical_trial_referral_quality) and	BENCH ERROR (red) — validator defect,

Claim	How checked	Found	Confirmed?
		reported two that were not dispatched. Both later cleared as NOT-FIRED, so no finding changes	immaterial to outcome
Prize table not applicable	Deck doctrine	Both benches wrote “not a pre-revenue project developer → PRIZE-TABLE inapplicable.” The doctrine trigger is a genuinely time-gated/private unverified item, which the redacted minimum plainly is. Both benches applied the wrong test	BENCH ERROR (both) — table built below
Legacy price alert status	Pack tape \$4.9599 vs the armed level	The alert has already fired. Its own text says below 5.0 the generating thesis is falsified and the position is capped at a ≤\$35k speculative tag	CONFIRMED — the cap binds today

PROPOSED ENTRY BANDS

Sizing is governed by the already-tripped sensor, not by conviction. The armed alert fires below \$5.00 and the pack print is \$4.9599. Under its own terms the *generating* thesis (the Q1 operational turn, +10.5%) is falsified and this name is not court-ready for a full sleeve. The post-Q2/OVO structural thesis in this deck is a different thesis, but it does not inherit the old sensor’s budget. Therefore:

- **Immediate starter (tranche 1): BUY ~\$4.90–5.05, hard cap \$35,000 ≈ 0.15% of book (~7,000 shares).** This is explicitly the speculative operational-turn tag the sensor permits, not a position. Basis: consensus-class bear case already transacted at –24%, balance sheet materially de-levered (\$12.3M borrowings / \$63.6M availability), decision document lands within days.
- **Tranche 2 (the real decision): +0.15% of book, only after the Q2 FY26 10-Q, only if ALL of:** (i) annual guaranteed minimum royalty disclosed at ≤\$3.0M/yr with no escalator above \$5.0M through FY29; (ii) H1 FY26 operating cash flow **positive excluding the refund**; (iii) assumed OVO liabilities ≤\$15M net; (iv) no undisclosed Ontario lender claim against the OVO opcos. Pay up to \$5.60 for this tranche — a clean note is worth chasing, because the redaction resolving benignly is the whole fork.
- **Tranche 3 (+0.10%, to a maximum sleeve of 0.4%):** only on the Q3 FY26 print showing ex-refund adjusted operating income ≥\$6M with OVO consolidated and not dilutive. Pay up to \$6.50.
- **No add below the entry.** This is not an averaging-down name: the float is 4.4M shares and the unknown is binary. Weakness before the 10-Q is information, not a discount.
- **Exits / trims.** Trim half at \$7.20 (our base-case fair value; ~5.5x FY27 EBITDA of ~\$19M less net debt). Trim the rest at \$9.00–11.20 if a thin-float momentum overshoot delivers it — take it, do not hold for the FY2030 story in a 4.4M-share float. **Hard stop on disclosure, not price:** exit in full within two sessions if the 10-Q shows a guaranteed minimum >\$5M/yr or **escalating above \$7M**, or assumed liabilities >\$25M. **Price stop: close below \$3.60** (≈27%

below entry; the level at which the market is pricing FY27 EBITDA under \$12M and our thesis has no remaining support) — sized so the full 0.4% sleeve losing 27% costs ~0.11% of book.

- **Liquidity rule:** no single day's trading may exceed 10% of the trailing 20-day ADV, and the ADV number must be pulled from IBKR before tranche 2 — our current ADV figure is an estimate, not a measurement.

Catalyst dates: Q2 FY26 10-Q, statutory due ~**2026-09-15** (filing date unconfirmed; cadence-derived). Q3 FY26 print ~**2026-12-09** (UNCONFIRMED — VNCE always issues a separate “Announces Reporting Date” press release and none exists; <https://investors.vince.com/press-releases/default.aspx>). OVO wholesale launch: H2 FY27, no dated disclosure.

ARMED SENSORS

(armed provisionally with this deck; session adjudication ratifies)

- price alert: fires below 3.6 (deck-provisional: Thesis-invalidating stop: market pricing FY27 EBITDA under \$12M, no remaining support)
- filing watch: 10-Q until 2027-03-09 (deck-provisional: Q2 FY26 10-Q carries the redacted royalty minimum, assumed OVO liabilities, ABL Third Amendment and H1)
- dated pack VNCE|2026-09-15: VNCE: Q2 FY26 10-Q statutory due date (period ended 2026-08-01); cadence shows 10-Q files same day as results 8-K, and the 9/10 8-K had no c
- dated pack VNCE|2026-11-07: VNCE: Last date to harvest a loss in stock and still re-enter before the December print without a wash-sale collision (date confirmed=False)
- dated pack VNCE|2026-12-09: VNCE: Estimated Q3 FY26 print; issuer has not published its reporting-date PR (date confirmed=False)

PRIZE TABLE + VOL READ

Triggered because the guaranteed minimum royalty is genuinely private and time-gated (redacted in the filing, resolving in the 10-Q). Both benches declared the table inapplicable using the wrong test; corrected here. Anchor = today's structure (\$64M cap, \$12.3M borrowings, FY25 adjusted EBITDA \$15.1M, EV/EBITDA $\approx$ 5.0x), then adjusted per branch.

Scenario (12 months)	Path	EBITDA / multiple	Price	p
Bear	Minimum $\geq$ \$5M and escalating; OVO dilutive; refunds stop; availability compresses	~\$10M @ 4.0x	\$1.60	0.20
Muddle	Minimum ~\$3M; OVO neutral; core flat; no refunds	~\$15M @ 4.5x	\$4.10	0.35

Scenario (12 months)	Path	EBITDA / multiple	Price	p
Base	Minimum ≤\$3M; OVO accretive FY27 (+\$3–5M); core +5%	~\$19M @ 5.5x	\$7.20	0.30
Prize	OVO path to \$100M sales credible; brand licence re-rated; thin float overshoots	~\$22M @ 7.0x	\$11.20	0.15

EV = \$5.60 vs \$4.96 spot = +12.8%. That is a starter-sized edge, not a sleeve-sized one, and it is the honest output.

Expression math (shown, per doctrine). - Table dispersion: $\sigma_{\text{table}} = \$3.08 = 62\%$ of spot over 12 months. - Our own price for a 12-month **\$7.50 call**: $C_{\text{ours}} = \sum p_i \cdot \max(S_i - K, 0) = 0.30 \times 0 + 0.15 \times \$3.70 = \$0.555$. Black-Scholes on the same spot: **\$0.57 at 60% IV, \$0.96 at 80%, \$1.35 at 100%**. Break-even IV where the chain equals our table: **59.2%**. For a \$10.00 call, $C_{\text{ours}} = \$0.18$, break-even IV **52.9%**. - Realized vol: a stock that ran +154% off \$1.95 and dropped ~24% in a session is realizing well north of 90% annualized. **RV ≈ 90–110% (estimated); chain IV estimated 75–95%; IV percentile estimated 80th–95th post-print.** All three are estimates — **we do not have a verified chain and per the TSSI lesson we will not substitute the underlying's aggregate IV feed for chain-level midpoints.** - **VRP = IV – RV ≈ –15 to –25 vol points (estimated, negative).** Premium is *not* rich relative to what this tape actually does, so the premium-selling gates do not open: no covered calls, no cash-secured puts. Selling a \$4.00 put would also hand us the exact branch (a bad 10-Q) we are trying to avoid, in a 4.4M-share float where assignment is not a costless outcome. - **Buying calls fails too:** any plausible chain IV (75–95%) sits far above our 53–59% break-even, so the chain would be charging us \$0.96 for something our own table says is worth \$0.56. Add microcap option spreads that routinely run 30–60% of premium and the edge is gone twice. - **Bimodality:** the table is fork-dated on a document arriving in days. A single 12-month vol number is the wrong lens — the near-term distribution is two-humped (\$1.60–4.10 versus \$7.20+) with very little mass in the middle, which is precisely why a long-dated option is mispriced *for us* in both directions and why the correct expression is a small stock position staged across the fork. - **INSTRUMENT RECOMMENDATION: COMMON STOCK, staged.** Output of the arithmetic above, not a preference. Revisit only with real chain quotes. - **TAX OVERLAY:** treating 2026 as a harvest year, the loss branch must land by **2026-12-31**. Every listed expiry that would cover the December print is January 2027 or later, which **defers the loss into 2027** — excluded under the harvest rule, and the edge here does not remotely dominate numerically (it is negative). Common stock is harvestable within the year. Note the collision: to harvest a loss and re-enter before the ~Dec 9 print, we must sell by **2026-11-07** (31-day wash-sale wait); harvesting any later forces us either to sit out the catalyst until ~mid-January or to abandon the harvest. Decide before November 7 or not at all.

What remains unverified

1. **Annual guaranteed minimum royalty under the OVO license (redacted).** Not drainable now. Estimate **\$2.5–5.0M/yr in year one, with a plausible escalator to \$6–10M by**

FY29; basis: single-digit retail rate on ~\$50M of current OVO sales, adjusted upward per the sibling base rate that brand-management licences set minimums at 60–90% of *expected* (not current) royalties keyed to a stated growth target (\$100M+ by FY2030). $p(\text{year-one minimum} \leq \$3.0\text{M}) = \mathbf{0.45}$.

2. **Assumed OVO liabilities in purchase accounting.** Not drainable now (10-Q). Estimate **\$8–25M gross, \$5–15M net of the IP-proceeds recapitalization**; basis: comparable ~\$50M-sales apparel opcos carry 2–4 months of payables plus lease liabilities on 12 doors.
3. **H1 FY26 operating cash flow excluding the tariff refund.** Not drainable now (10-Q cash flow statement). Estimate **–\$5M to +\$3M**; basis: pack OCF series is Q1-only and negative (–\$11.8M at 5/3/25, –\$3.9M at 5/4/24), partially offset by the \$3.3M YoY inventory reduction and lower interest on \$12.3M of borrowings. $p(\text{positive ex-refund}) = \mathbf{0.40}$.
4. **Whether an Ontario lender claim exists against the OVO operating companies.** Not drainable now (10-Q legal proceedings / commitments). Estimate **p(material claim disclosed) = 0.20**, magnitude \$0–10M; basis: nominal-consideration opco purchases carry residual creditor claims roughly one time in five.
5. **Actual Q2 FY26 10-Q filing date.** Drainable now (EDGAR full-text/RSS poll on CIK 1579157).
6. **Exact current public float and P180's current holding.** Drainable now (DEF 14A 4/16/26 beneficial-ownership table + Forms 4 / SC 13D-A).
7. **Trailing 20-day ADV, borrow rate, short interest.** Drainable now (IBKR).
8. **Chain-level midpoint IV, spreads, and open interest for VNCE Jan-2027 \$7.50/\$10.00, plus realized vol and IV percentile.** Drainable now (IBKR options chain — chain-level only, never the aggregate feed).
9. **Q3 FY26 earnings date.** Not drainable now (company issues a separate reporting-date PR; none exists). Estimate **2026-12-08 to 2026-12-12**; basis: issuer's own three-year Q3 cadence. $p(\text{within that window}) = \mathbf{0.75}$.
10. **OVO consumer demand direction.** Not drainable now — both consumer detectors returned UNCHECKABLE (BASELINE_ZERO heat feed; walmart_search=BOT_WALL; cohort_delta=BASELINE_ONLY); requires a second dated snapshot ≥ 30 days out plus a non-walled channel. Estimate **flat to –10% YoY search/rank velocity**; basis: base rate for artist-linked apparel labels four-plus years past their peak cultural moment. $p(\text{demand is actually accelerating}) = \mathbf{0.30}$.
11. **Additional IEEPA refund amounts beyond the ~\$2.6M embedded in the Q3 guide.** Not drainable now. Estimate **\$0–4M in FY27**; basis: the \$10.4M Q2 recovery scaled to remaining eligible entry periods. $p(\text{any FY27 benefit}) = \mathbf{0.50}$.
