

PITCH — XPEV — VERDICT

ADJUDICATED 2026-09-16 — FLAT into Oct 1 (conviction 7/10). The court found nothing to own at this price; the reopen gates below are the only path back.

What we believe

XPeng is neither collapsing nor recovering. It is flat, and flat is not what either the original brief or the red bench described.

The unit line: 8 months of 2026 delivered 243,111 vehicles, **−10.5% year-over-year**, with the damage concentrated in Q1 (62,682, −33.3%). August printed 39,107, +4% YoY, the third straight month of YoY growth — but Jun/Jul/Aug 2025 were the 2025 trough (~34.6k/36.6k/37.7k), so the “growth streak” is a comp artifact. Sept-2025 was 41,581 and Oct-2025 was 42,013. The Q3 guide of 115–121k units means September lands somewhere in 37.9k–43.9k, and the **midpoint prints −1.7% YoY**. The streak mechanically ends on October 1 unless September beats a record.

The profit line: Q2-26 revenue ¥19.74b (+8.0%), but vehicle revenue only ¥17.05b (+1.0%) and **vehicle gross margin 12.1% vs 14.3% a year ago**. Net loss ¥1.34b vs ¥0.48b — near-tripled — on a record 103,295 units. The offset the red bench left out: Q1-26 loss was ¥1.78b, so the loss **narrowed 25% sequentially**. Cash ¥40.48b but **down ¥1.61b in a record quarter**.

The floor: the robotics subsidiary raised >\$900M at >\$6.3b post-money (IDG-led, Tencent/Alibaba). XPeng retains ~86% ≈ **\$5.4b of mark**, plus roughly **\$2.4b net cash (unverified — debt line never fetched)** = ~\$7.8b, or **\$8.14 per ADS**, against a ~\$9.96b market cap at \$10.40. The entire auto business plus Robotaxi is being valued at **~\$2.2b, about 0.22x sales**.

So the belief is narrow and cheap-sounding: *at \$10.40 you are paying ~\$2.29/ADS for a ~\$10b-revenue automaker, because the market refuses to credit an illiquid private mark*. That is a real asymmetry. It is not yet an entry, because the two variables that decide whether the auto stub is worth \$2b or \$0 — September units and Q3 vehicle margin — both print after today, and both benches converged on FLAT.

What the market believes

Consensus (31 analysts, post-print) sits at **FY26 revenue CN¥86.8b**, cut from ¥92.5–94.1b. Do the bridge: H1 was ¥32.77b, Q3 guide midpoint is ¥22.55b, which forces **Q4 to ¥31.5b ≈ 165k units** against an all-time record of 116,249. That is a +40% sequential quarter no monthly datapoint supports. Our number is ¥80–82b (−6% to −8%).

At the same time, the market is not paying for the robotics mark at all, and it is short ~36–47M ADS (unreconciled between sources) at 2.56 days-to-cover on 14.2M ADV. The tape is at a fresh 52-week low, –63% from \$28.23. So the market simultaneously believes (a) revenue estimates that are too high, and (b) an equity value below the sum of the disclosed parts. Those beliefs are inconsistent, which is usually where money is, and usually also where a value trap is.

Why we might have edge

1. **The Q4 bridge.** The ¥86.8b consensus is arithmetically dependent on a quarter 42% above the year-ago comp. That is checkable from published monthly counts. We think consensus grinds down another 6–8%.
2. **The comp calendar.** Neither the sell-side headline nor the red bench ran the seasonality check: Q3-25 = 116,007 vs a Q3-26 guide of 115–121k (–0.9% to +4.3%); Q4-25 = 116,249 is the hardest comp of the year; FY26 units track ~404–414k vs FY25 429,445, a **–4% to –6% unit decline year**. Knowing the “recovery” headline flips negative on October 1 is a real, dated, tradable piece of information — the red bench called that print “low-information” and was overturned on it.
3. **The stub math.** A third-party-priced subsidiary round creates a public mark that, added to cash, exceeds most of the parent’s cap. Few sell-side models carry it explicitly.
4. **We know where our own analysis broke.** The originating brief made a sign error and built a cross-check on a fabricated delivery count. We caught both. A process that publishes its own refutations is worth something.

Why it might be priced in

Honestly: most of it probably is.

- The “third consecutive month of YoY growth” framing was **published by CnEVPost on 2026-09-01** — the red bench tagged its own finding NOVEL when it was consensus on the tape the same day.
- “Loss nearly triples” was also a wire headline. Nothing in the Q2 decomposition is private information; the company **disclosed 12.1% vehicle margin in its own bullet list alongside the 20.7% blended figure**, so the red bench’s “masking” charge fails on the facts.
- The consensus source we lean on is literally titled *analysts are cutting their estimates* — the divergence is **decaying, not static**. We are betting on the last 6% of a cut already in motion.
- The –63% drawdown has already paid for the bear case. And the stock printed a **new low 16 days after** the \$6.3b robotics mark was announced — the market saw the mark and sold anyway. Our own mechanism note explains why (illiquid, preferred-stacked, non-distributable), which means **our doctrine predicts the discount persists**. Betting on it closing is betting against our own model.
- 0.67x EV/S on the consolidated name is not a distressed multiple for a Chinese EV maker in a price war.

What could go wrong

Failure 1 — The margin is structural, not a launch-cost trough (most likely). The 12.1% vehicle margin is the price war, not G9L/GX ramp costs. Q3 prints 11–12%, Q4 worse on the hardest comp of the year, cash burn continues past the ¥1.61b QoQ, and the stub goes from cheap to correctly-priced-at-zero. *Tripwire: Q3 vehicle margin < 12.0%; monthly ASP proxy = (quarterly vehicle rev ÷ units) falling two prints in a row; cash down >¥2b QoQ.* Fully monitorable.

Failure 2 — The \$5.4b floor is not a floor (the reflexive/structural leg). The robotics mark is a private SPA we have not read. Standard venture terms — 1x liquidation preference, no distribution rights to the parent, transfer restrictions — mean the parent's "86%" is a residual claim on an illiquid asset, not \$5.4b of value. A haircut to 50–70% of the naive mark takes the SOTP floor from \$8.14 to roughly **\$5.90–\$7.00**, and every band below is wrong.

Layered on that is the flow structure, and here our own behavior is part of the problem. Our size is *not* the issue: at ADV 14.2M ADS (~\$148M/day), a 1.0%-of-book position is on the order of 25k–100k shares, i.e. **0.2–0.7% of one day's volume** — we can exit inside a session and we move nothing. The reflexive damage runs the other way. Our entry gate ("buy if September ≥ 41,581") is the *same* trigger the 36–47M-ADS short base uses to cover, on 2.56 days-to-cover. A good October 1 print gaps the stock, the shorts and we buy the same tick, and our confirmation discipline systematically fills us at the top of the squeeze — then the squeeze unwinds into a November margin print that our gate never tested. Three of our doctrines collide here: *buy below sum-of-parts* says buy now at \$10.40; *never add into a name making fresh 52-week lows* says do not; *only enter on confirmation* breaks the tie by guaranteeing we are the last and worst-priced buyer. We have no rule that resolves this, and we should say so rather than pretend the gate is free. *Partial tripwire: a robotics follow-on or down-round disclosure; HKEX/EDGAR placement filings.* No tripwire at all on the SPA terms themselves — they are private and unfiled.

Failure 3 — NO MONITORABLE TRIPWIRE. A state action or structural discontinuity we cannot sample: PRC or US regulatory change to the dual-primary/ADR structure, a data or autonomy rule that halts the Guangzhou driverless permit path after an incident, an index-provider deletion forcing passive supply, or an insider/related-party fact sitting in the two **unread Form 4s (2026-07-06, 2026-07-16)** that are themselves anomalous on an all-6-K foreign-private-issuer docket. There is no filing cadence, no monthly series, and no satellite pixel that leads any of these. **Unknown-unknown class: sovereign/regulatory discontinuity in a jurisdiction whose disclosure surface we cannot sample** — with a secondary class of **insider-conduct / consolidation-accounting opacity** (the common-control-merger detector was NOT-FIRED on an *absence* in the 6-K inventory, which is not the same as a negative). We cannot arm a sensor for these. We can only size for them, which argues for the ≤0.5-sleeve cap regardless of how good the entry looks.

If this position loses money, the most likely reason will be that we bought a flat-volume, margin-compressing automaker for the sake of an illiquid robotics mark we never read the terms on, and the market went on refusing to credit that mark — exactly as our own mechanism note said it would — while the auto stub we thought was free turned out to be correctly priced at zero.

PROPOSED ENTRY BANDS

Both benches say no entry today. Book stays FLAT into 2026-10-01. These are reopen bands, not orders.

Band A — value/floor band (no catalyst required, half weight). Buy **\$8.15–\$8.60**, size **0.25% of book**. Basis: $\$8.14/\text{ADS} = (\$5.4\text{b robotics mark} + \$2.4\text{b net cash}) \div \sim 958\text{M ADS}$. At or below that, the auto business is free. **Hard precondition: unverified item U1 (net debt) must be drained first** — if net cash is materially below \$2.4b, this band moves down and must be recomputed before any order rests.

Band B — unit-confirmation band (2026-10-01). Only if September deliveries $\geq 41,581$ (true YoY growth vs Sept-25 — *not* the guide floor of 37,866, which is near-locked and proves nothing). Buy **\$10.40–\$11.60**, size **0.35% of book**. If the print gaps $>8\%$ on the open, **do not chase** — this is the short-cover squeeze described in Failure 2; work the order or stand down. If September lands 37.9k–41.5k (the likely case, midpoint -1.7% YoY): **no entry**, and expect a lower reopen at Band A.

Band C — margin-confirmation add (~2026-11-16). Only if Q3 vehicle gross margin $\geq 14.0\%$ (proof the 12.1% was launch-cost trough, not price war) **and** the Q2/Q3 cash-flow statement shows positive operating cash flow. Add **+0.40%**, up to a **1.00% of book total, hard cap** — inside the ≤ 0.5 -sleeve limit both benches set.

Trims / exits. - Q3 vehicle margin $< 12.0\%$ → exit any Band A/B stock in full, regardless of price. - Close $< \$7.80$ → SOTP floor thesis is broken (mark or cash is wrong). Exit, do not average. - $> \$12.60$ with no gate cleared → trim half; the re-rate is running ahead of the evidence and the prize table says the next leg needs the robotics mark to be *credited*, not just to exist. - Targets from the rebuilt table: **\$13.40 (0.5x) / \$16.60 (0.8x) / \$18.70 (1.0x)**. Nothing above 0.8x without a verified peer multiple set (U10).

Catalyst dates. 2026-10-01 ± 1 bd September deliveries (cadence-inferred from 6-K dates 09-01/08-03/07-02/06-01/05-04 — **not company-confirmed**); 2026-11-01 October deliveries; **2026-11-16 Q3 results — yfinance-derived, UNCONFIRMED by any company PR**; 2026-12-01 November deliveries; 2026-12-18 December option expiry / tax-year line; 2027-01-01 December + Q4 deliveries. Print proximity today: ~ 14 trading days out, **not** inside the 5-day blackout.

ARMED SENSORS

(armed provisionally with this deck; session adjudication ratifies)

- price alert: fires below 9.6 (deck-provisional: -8% from pack print extends the fresh-low regime; check for forced/passive supply before treating Band)
- filing watch: 6-K until 2027-03-09 (deck-provisional: Monthly delivery release, 1st business day cadence - Band B trigger at Sept $\geq 41,581$ and the Oct/Nov c)
- dated pack XPEVI2026-10-01: XPEV: September 2026 deliveries 6-K; guide floor 37,866 near-locked, true-growth gate 41,581, band 37.9k-43.9k (date confirmed=False)
- dated pack XPEVI2026-11-01: XPEV: October 2026 deliveries 6-K vs Oct-25 comp of 42,013 (date confirmed=False)
- dated pack XPEVI2026-11-16: XPEV: Q3-2026 results - vehicle margin $\geq 14\%$ is the Band C gate; date is yfinance-derived and NOT company-confirmed (date confirmed=False)
- dated pack XPEVI2026-12-01: XPEV: November 2026 deliveries 6-K (date confirmed=False)
- dated pack XPEVI2026-12-18: XPEV: December option expiry and the tax-year line - any loss branch must land on or before this date (date confirmed=True)
- dated pack XPEVI2027-01-01: XPEV: December + Q4-2026 deliveries vs the hardest comp of the year (Q4-25 = 116,249) (date confirmed=False)

What remains unverified

1. **Consolidated operating cash flow and gross/net debt.** Cash ¥40.48b is gross; the debt line was never fetched by either bench, so “\$2.4b net cash” — load-bearing for the entire \$8.14 floor — is an estimate, not a fact. Drainable now from the Q2 6-K.
2. **Robotics SPA terms** — liquidation preference, ring-fencing, whether any proceeds are distributable to the parent, standstill/transfer restrictions. Private, unfiled. Not drainable.

3. **September 2026 deliveries.** Time-gated to 2026-10-01.
4. **Q3-26 vehicle gross margin.** Time-gated to ~2026-11-16.
5. **Form 4 contents** (2026-07-06, 2026-07-16) — who, how much, and whether this signals loss of foreign-private-issuer status (which would mean a step-change to 10-K/10-Q/proxy cadence and newly visible insider selling). Drainable now.
6. **Confirmation of the Q3 earnings date.** Not drainable until the company issues a PR.
7. **Options chain, chain-level midpoint IV, IV percentile, and realized vol.** No chain in the pack. Drainable now via broker.
8. **Short interest reconciliation** (47.19M vs 36.47M ADS). Drainable now.
9. **Peer EV/S multiple set for the auto comp** — the 0.5x/0.8x/1.0x ladder is asserted by both benches and verified by neither. Drainable now.
10. **FY26 actual revenue vs the ¥86.8b consensus.** Time-gated to the Q4/FY print (~Mar 2027).
11. **Guangzhou/Zhaoqing capacity buildout** funded by the \$900M — no satellite pull was run.
12. **Whether any 2026 parent-level placement or lockup exists** on HKEX. Drainable now.

PRIZE TABLE + VOL READ

Anchor: today's price **\$10.40**. Second anchor: the parts floor **\$8.14/ADS**. Adjust from those two, not from the \$28.23 high.

#	Scenario	p	Price	p × price
S1	Price war structural: Q3 vehicle margin <12%, FY units -6%, robotics mark goes stale, stub → 0	0.22	\$6.50	\$1.43
S2	Flat grind: margin 12–13%, units flat, no re-rate, discount to parts persists (our own mechanism note's prediction)	0.33	\$9.50	\$3.14
S3	Base recovery: Sept ≥41.6k, Q3 margin ~14%, 0.5x auto EV/S	0.28	\$13.40	\$3.75
S4	Bull: margin ≥15%, Robotaxi permit expansion, robotics up-mark, 0.8x	0.13	\$16.60	\$2.16
S5	Blue sky: 1.0x + robotics IPO filing that makes the mark liquid	0.04	\$18.70	\$0.75

EV = \$11.22 vs \$10.40 spot = +7.9%. $\sigma_{\text{table}} = \$3.63 = 35.0\%$ of spot over a 99-day horizon (to 2026-12-18) = 67% annualized.

That EV is thin, and it is the honest reason there is no immediate entry. Red's bench declared a prize table N/A on the grounds that XPEV is not a pre-revenue developer; we overrule that — items 3 and 4 above are genuinely time-gated and private, which is the trigger condition — but red's underlying instinct was right that the prize is not large.

Vol read. *There is no options chain in the evidence pack* — this is a gap, logged as U7. Realized vol is likewise not measurable from the pack (no price series), so we estimate it from the 52-week range: $\log(28.23/10.545) = 0.985$, and for a driftless walk $E[\text{range}] \approx \sigma\sqrt{(8T/\pi)}$, giving **RV $\approx$ 62% annualized — an upper bound**, since the -63% trend inflates range-based estimates. Call it **50–62%. IV percentile and VRP are therefore UNCOMPUTABLE today**, not zero — do not treat their absence as “vol is fair.”

Expression math, run off the table itself (undiscounted at 4%, $T = 0.271y$):

Strike (Dec-18-26)	C_ours = $\sum p_i \cdot \max(S_i - K, 0)$	Vol that makes BS agree	P_ours	Vol that makes BS agree
\$8.00	\$3.52	109%	\$0.33	62%
\$10.00	\$2.14	90%	\$0.93	55%
\$12.50	\$1.02	79%	\$2.29	43%
\$15.00	\$0.35	68%	—	—

Read these against $\sigma_{\text{table}} = 67\%$ annualized and $RV_{\text{est}} \approx 62\%$. Note the spread between the call-implied breakevens (68%→109% as you go down the strikes) and the put-implied ones (43%→62%): **that spread is the bimodality, not an edge**. The table is fork-dated on two binary events — the October 1 unit sign flip and the November 16 margin print — so it is genuinely two-humped (a \$6.50 cluster and a \$13–18 cluster) and no single lognormal σ can fit it. Any straddle or ratio structure priced off one IV number here is mis-specified by construction.

Instrument recommendation — the output of the arithmetic, not a preference: - Primary: STOCK, and not yet. The EV edge is +7.9% against a 35% dispersion. That is not a ratio that survives paying option premium. - **Calls: conditionally allowed for the Band C add only.** The test is explicit: pull the **chain-level midpoint** on the Dec-18-26 \$12.50 call. If the mid is **below ~\$1.02**, the fork is not priced and the gated add may be expressed in calls. If it is above, buy stock or nothing. Use real quotes on that specific strike — **never the underlying aggregate IV feed; the TSSI lesson (aggregate 71 vs chain 101) is exactly this failure mode**, and on a dual-listed ADR with a bimodal event path the divergence will be worse, not better. - **Cash-secured puts: the honest near-miss.** A Dec-18-26 \$8.00 put is worth \$0.33 on our table, which corresponds to ~62% vol — i.e. **right on top of our RV estimate**. It is fair, not rich. Selling it gets us paid a token to buy at the parts floor, which we want to own anyway. **Gate it: only sell if the chain mid on that strike implies >70% and only after U1 (net debt) is drained**, because a wrong net-cash number moves the floor to \$5.90–\$7.00 and turns a “get paid to buy the floor” into “get assigned above the floor.” - **Covered calls: N/A** — no position to cover.

TAX OVERLAY. The loss branch must land in the intended tax year. **Dec-18-2026 expiry is the correct tenor** and it is not a compromise: it captures every catalyst that matters (Oct 1 units, Nov 1 units, Nov 16 margin, Dec 1 units) and the loss lands in 2026. A Jan-2027 or later expiry would

push a realized loss into 2027; with EV at only +7.9%, **the edge does not numerically dominate the deferral**, so any expiry past Dec 31 is **excluded** during a harvest year. Note the residual: the December-31 delivery/Q4 print (2027-01-01) falls just outside a Dec-18 expiry — that is an accepted, deliberate cost of keeping the loss in-year, not an oversight. Stock has no such constraint, which is a further point in its favor as the primary instrument.

Primary sources relied on: the Q2-2026 results exhibit at <https://www.sec.gov/Archives/edgar/data/1810997/000119312526364050/d75446dex991.htm> and the August-2025 delivery 6-K at <https://www.sec.gov/Archives/edgar/data/1810997/000119312525193287/d70827dex991.htm> (which fixed the brief's wrong 37,603 base — the real figure is 37,709).

ADJUDICATION — 2026-09-16 15:37Z

Consensus FY26 ¥86.8b implies Q4 +42% y/y vs the hardest comp (NOVEL divergence, -6 to -8% magnitude). No minimum starter.

REOPEN GATES: Sept deliveries ≥41,581 (true YoY growth) AND Q3 vehicle margin ≥14% in Nov; cash-gate on OCF from the Q2 6-K → ≤0.5 sleeve
