

DEAL SUMMARY

American Housing Corp.

The American Housing Corporation (AHC) is a vertically-integrated homebuilder + housing manufacturer designed to solve “missing middle” housing at scale via (i) a standardized rowhome format, (ii) a factory-manufactured componentized building system that fits in standard shipping containers, and (iii) an internal software layer (Alamo) to run underwriting → production → onsite assembly.

FLUX RECOMMENDATION

Co-Invest

Series A Investment

DEAL SNAPSHOT

Issuer	The American Housing Corporation	Ownership	1.75%
Round	Series A	Instrument	Series A Preferred (Priced)
Allocation	Co-Invest: \$5,000,000	Valuation Cap	\$235,000,000 (pre-money)

THE OPPORTUNITY

Residential construction has not meaningfully benefited from industrial-scale productivity improvements, despite a persistent housing shortage and structurally high construction costs. AHC’s thesis is that the path to scale is not “modular houses as a product,” but a repeatable, software-orchestrated manufacturing + assembly system that can be deployed across geographies with predictable cost, timeline, and quality.

AHC’s approach is componentized (e.g., bathrooms/kitchens + panels) and built for factory repeatability; each module is designed to fit standard shipping containers for cost-efficient logistics and national deployment. That production line is married with a software layer (Alamo) as the “manufacturing OS.” Alamo is intended to manage underwriting, site planning, factory production, and onsite assembly—creating a compounding operational dataset and tighter feedback loops than contractor-led construction.

AHC is explicitly structuring the business so real estate capital can fund land + builds (PropCo) while the venture-backed OpCo captures high-margin manufacturing + system IP—aligning the capital stack with the growth bottleneck (production capacity) for efficient scaling.

AHC is raising \$50M to build out their first “Gigafactory” that will enable AHC to drive costs lower, expand margins, and scale production from dozens of units a year to over a thousand. The Series A round is fully subscribed and led by Contrary Ventures. Our participation in their Seed round and leading their last Bridge round gives our LPs exclusive access to allocation.

WHY NOW

Manufacturing inflection AHC has moved from concept to validated system quickly, and the binding constraint is now production capacity—not demand.	Capital structure advantage The OpCo/PropCo model is designed to scale with real estate capital while preserving venture-style upside in the manufacturing + software layer.	Execution velocity The team has shown unusually fast iteration and delivery cadence—de-risking “can they build” and shifting the question to “can they scale.”

TEAM

Name	Role	Background
Riley Meik	CEO	Experience from SpaceX Starship, as founder of Evolution Space, building vertically integrated solid rocket motors, and as founder of Zero where he built kits for net-zero homes.
Bobby Fijan	Head of Real Estate	Founder of Form Developers and a partner at Cross Properties. Founder of Tailorbird - a software platform for multifamily owner operators.

Name	Role	Background
Harris Rothaermel	Head of R&D	Embedded systems experience from NASA Glenn and as founder of Starlight Labs - a game studio using generative AI.
Will Davis	Head of Software	Former founder/CTO (Tudu) - a modern material procurement platform - and has manufacturing automation experience from General Motors

TECHNOLOGY & MOAT

What's already true

- Standardized building system + factory production designed for repeatability and quality control.
- \$230/sf build costs on their demo unit and a roadmap to driving costs lower to \$180/sf and increasing margins from 15% to 30%
- Speed of manufacturing is several times faster than traditional stick-built; currently it takes 8 weeks to manufacture a 1800 sf townhouse and just 5 weeks to install and finish on site
- Alamo software layer is already in production and supporting the full lifecycle

What compounds the moat

- **Manufacturing learning curve:** yield, automation, cycle-time compression, and procurement leverage as volume scales.
- **Software-driven orchestration** across underwriting → production planning → onsite assembly (data flywheel + operational switching costs as volume scales).
- **Capital flywheel (OpCo/PropCo):** real estate capital increases throughput; throughput improves unit economics; improved economics attracts more capital and expands markets.

5-YEAR RETURN SCENARIOS

Scenario	FY31 Rev	Gross Margin	Rev Multiple	Co. Value	MOIC	Weight
Bear	\$244M	15%	0.6x	~\$156M	~0.38x	10%
Below Base	\$720M	25%	1.2x	~\$864M	~2.12x	20%

Moonshot	\$4.20B	40%	5.0x	~\$21.0B	~66.3x	5%
Probability-Weighted Expected MOIC					~11.25x	

Can AHC scale manufacturing capacity fast enough—and maintain quality + unit economics—so that its software + system advantages translate into durable, defensible market share (instead of becoming “just another builder”)?

If true → AHC becomes the scaled, software-orchestrated manufacturing layer for missing-middle housing—capturing tech-style value via repeatable production, cost-down, speed, and a financing structure that can expand capacity with real estate capital.

If false → Factory scale proves slower/more capital intensive than expected, margins compress toward conventional construction, and AHC’s differentiation is competed away by incumbents and other prefab players as the market normalizes.

Our View:

AHC is one of the few housing/manufacturing plays we’ve seen that is explicitly engineered for scale across product format + manufacturing system + software + capital structure—not merely “prefab as a product.” The team’s speed from inception to demo home is a strong signal of execution capability, and the Series A is the right moment to fund the capacity step-function. We recommend LPs participate in the round by using our existing-investor position to optimize allocation.
