

SignalOS Buy Book — Two-Stage Verified Analysis

2026-06-28. The all-cap + international harvest/buy book. Each name passed BOTH SignalOS deep two-mode diligence (generator) AND an independent skeptic (different model, default-REJECT, re-pulled primary sources). 76-agent workflow. PFIC-clean, disjoint from the Parametric SMA. READ-ONLY; not investment advice.

How to read each entry

- **Bull case (SignalOS):** the generator's verified thesis. **Risk:** the load-bearing caveat it flagged.
- **Skeptic:** an independent agent re-pulled the filings, defaulted to REJECT, and only cleared it on affirmative confirmation — often correcting a generator over-claim.

High-Conviction Core — our diligenced value names

These pre-date the all-cap screen — separately diligenced (full DDs + the two-pass **BOOK_REVIEWED** : SignalOS rigor + hard skeptic). Bull = the SignalOS thesis; Skeptic = the disconfirmation verdict. This is the conviction sleeve the 22-name screen book sits **ALONGSIDE**, not instead of.

DFIN — compliance software · conviction HIGH

Bull case (SignalOS): software-transition compounder mis-priced as dying-print: SW now 47% rev/45% profit, +21% EBITDA; EBIT GROWS on declining rev (real mix-shift); the scary GAAP net-income drop was a 1-time non-cash pension settlement; 8.6x EV/EBIT, 10.5% FCFy, 1.4x lev, ~5%/yr buyback. **Key risk / KILL:** prolonged IPO/M&A deal-freeze (EBIT toward ~\$115M) / software mix stalls below 50% of profit / leverage rises on a debt-funded deal **SignalOS verdict:** OWN-NOW — cleanest R/R; software-transition compounder mis-priced as dying-print **Skeptic verdict:** DEMOTE — its re-rate catalyst (IPO/M&A recovery) IS the book's #1 macro risk; both legs fail together in a risk-off. Trust-least.

GCT — B2B furniture/3PL · conviction HIGH

Bull case (SignalOS): net-cash(31% of mcap, 97% US/free) distributor+3PL mis-priced as China-fraud; 5.1x EV/EBIT, 15.5% FCFy, KPMG-audited/no-VIE; tariff PASS-THROUGH + SCOTUS struck IEEPA Feb-26; the honest catch = it's a 1P-distributor (29.8%-GM engine) not the 'asset-light marketplace' bulls sell; deserved discount = controlled-co (Wu 70.7% vote), NOT fraud. THE high-conviction find. **Key risk / KILL:** GM <22% for 2 quarters / auditor change off KPMG / organic (ex-acq) rev negative / Sec-232 furniture step-up effective Jan-2027 / Founder-Undertaking lapse ~Aug-2027 + privatization chatter **SignalOS verdict:** ACCUMULATE (HIGH) — net-cash China-distributor mis-priced as fraud; KPMG-audited, no-VIE **Skeptic verdict:** Trust-least — undisclosed China-origin GMV makes the tariff bear unsizable; controlled-co (Wu 70.7%). Basket-size only.

EVER — insurance marketplace · conviction MED (HALF-SIZE)

Bull case (SignalOS): online insurance lead-gen marketplace; cyclical-peak trap REFUTED — Q1 printed RECORD op-income + record 12.3% margin, still new-highs (the +132% was a trough base-effect, not a peak); net cash \$178M, zero debt. HALF-SIZE: ONE carrier = 40% of revenue + ~90% auto = concentration risk. **Key risk / KILL:** the 40%-customer concentration footnote worsens / TRUE YoY revenue decline (distinct from the seasonal Q1 dip) = re-opens the cyclical-peak hypothesis **SignalOS verdict:** ACCUMULATE half-size — cyclical-peak REFUTED (Q1 record op-income), net cash \$178M **Skeptical verdict:** Quarter-size — 40% single-customer + ~90% auto is a binary the multiple can't pay for; carrier can cut CPC without leaving.

EPAM — IT/digital-engineering · conviction MED (STARTER <=\$80)

Bull case (SignalOS): premium digital-product engineering at 6.2x EV/EBIT, net cash ~\$17/sh, 14.6% FCFy, de-rated -60% on AI-disruption + Ukraine-delivery fears. Geography DE-RISKED (India now #1 delivery); AI net-POSITIVE so far (\$125M AI rev, +Anthropic partnership). BUT organic growth low-single-digit + guide LOWERED; the AI-disruption SECULAR question is the open UNVERIFIABLE = starter only, not a conviction core. **Key risk / KILL:** organic cc revenue turns negative / delivery headcount must keep FALLING to defend margin (= AI compressing billable hours, the bear winning) / a >10% client emerges then churns **SignalOS verdict:** STARTER — 6.2x EV/EBIT, net cash ~\$17/sh, AI net-positive so far (\$125M AI rev) **Skeptical verdict:** Falling-knife option — AI-disruption secular question genuinely unverifiable; organic decel + guide lowered. (Also re-verified in the 22-name run.)

SBH — beauty retail/distrib · conviction MED-LOW

Bull case (SignalOS): Sally Beauty Supply + CosmoProf pro-distribution; 'dying retail' REFUTED — consolidated comps +1.3%, Sally comps positive w/ traffic AND unit-retail up; net debt 1.7x & FALLING; +17% was stale, latest qtr ~+4% gross-margin-led (Fuel-for-Growth). Return = re-rate + ~6%/yr buyback + de-lever, NOT organic growth. Ties the beauty theme. **Key risk / KILL:** Sally (consumer) comps turn NEGATIVE / net-debt/EBITDA rises (de-lever reverses) / GM gains fade **SignalOS verdict:** ACCUMULATE — 'dying retail' REFUTED (comps +1.3%, traffic up), de-levering **Skeptical verdict:** Levered equity stub — return = financial engineering (re-rate + buyback + de-lever), not growth; modest GM give-back compresses it.

BKE — apparel retail · conviction LOW (income-value)

Bull case (SignalOS): net-cash (\$5.73/sh) 33%-ROIC mall apparel retailer; the MELT thesis REFUTED — comps +5.1%, transactions +2.6% (rising TRAFFIC), store count flat. BUT the +37% EBIT that surfaced it was a 1-time \$19.1M litigation settlement -> underlying EBIT DECLINED YoY (the growth signal is a trap). Income-value 'paid-to-wait': 3.2% covered regular div + variable special. Buy the cash-return, NOT the growth. 6.8-7.3x EV/EBIT ex-settlement. **Key risk / KILL:** comps turn NEGATIVE / transactions roll over (the anti-melt tell breaks) / regular dividend cut **SignalOS verdict:** LOW income-value — net-cash 33%-ROIC mall apparel, MELT refuted (comps +5.1%) **Skeptical verdict:** Near-CUT — the +37% EBIT that surfaced it was a one-time \$19.1M litigation settlement; underlying EBIT DECLINED. Own the cash-return, not growth.

CRCT — crafting subscription · conviction LOW (income-value, thin)

Bull case (SignalOS): 89%-GM Cricut Access subscription annuity inside a declining-hardware shell; annuity GROWING but MATURING (penetration ~92%, net-adds halving, first sequential sub-decline); FCFy FLATTERED (14% headline -> ~7-9% normalized); income-value 'paid-to-wait' (4.4% div + buyback); Class-B = 5 votes -> 93% controlled = LOWBALL-take-under risk (not a premium). Accumulate-on-weakness, LIMITS. **Key risk / KILL:** paid-subscribers roll over QoQ / Platform (subscription) rev turns negative YoY / controller take-under proposal / recurring capital-return cut while cash is retained (pre-take-private tell) **SignalOS verdict:** LOW income-value — 89%-GM Cricut Access subscription annuity **Skeptic verdict:** CUT-from-basket / limit-only — 93%-controlled (5-vote Class-B) = lowball take-under risk, no floor; annuity maturing, first sequential sub-decline.

REPX — energy E&P (Permian) · conviction MED-LOW (HALF-SIZE energy; WATCH-not-add, already +31% YTD)

Bull case (SignalOS): Riley Permian small-cap E&P; symmetric-DD survivor (2026-06-27) = the first NON-consumer leg. The scary screen inputs are mischaracterizations: the '-17% EBIT' is -13% and 100% PRICE (WTI deck -14%) while production GREW +8% (Q1'26 oil +46% YoY); the \$70M GAAP 'loss' is a \$115M non-cash hedge MTM on +\$44M op-income; Silverback was an in-basin bolt-on (NOT a leverage-up Eagle Ford entry). Low-decline Yeso conventional (8yr PDP life); maint-capex-adj FCF ~12% of equity, div covered 3.5x; borrowing base RAISED \$400->425M. CAVEAT (IBKR live \$34.07, +31% YTD): ALREADY RE-RATED — base FV \$40 is only ~+17%, NOT the +75% the trap-filter's mis-stated \$22 spot implied. Modest upside, WATCH for a pullback to the high-\$20s. Half-size = commodity-cyclical + 1.7x net-debt. **Key risk / KILL:** WTI <\$58 AND a borrowing-base CUT at the Oct-2026 redetermination / net-debt/EBITDAX >2.5x / oil volumes roll below ~19,000 Bbls/d absent a divestiture / Permian gas+NGL negative realizations deepen and swamp the oil netback (Q1'26 gas -\$1.68/Mcf, NGL -\$6.22/Bbl = ~21% of volume value-destructive) **SignalOS verdict:** REAL-VALUE — '-17% EBIT' is price not roll-over; production +8%, div covered 3.5x **Skeptic verdict:** WATCH not add — already +31% YTD; base FV only +17%, already re-rated. Energy diversifier but re-correlates in a risk-off.

Screen-sourced book (all-cap + international) — 22 names, two-stage verified

ADBE — Software (US) · SignalOS: OWNABLE · durable=True · PFIC=na

Bull case (SignalOS): 36%-margin, ~95%-recurring software compounder de-rated to ~9-11x earnings/FCF on AI-disruption fear, not an earnings or accounting failure — honestly disclosed numbers still growing ~12% with a fortress balance sheet and heavy buyback. **Key risk (SignalOS):** Generative-AI commoditization of content creation (plus Figma) erodes Creative Cloud net-seat growth and pricing power, collapsing the terminal value the multiple is pricing — a secular melt that current filings cannot yet falsify. **Skeptic (PASS):** All material generator claims independently verified. Revenue \$25.2B TTM growing 12-13% YoY. Operating margin 36.1% TTM (generator correct),

though Q2 FY2026 compressed to 33.8% on SG&A/R&D surge — early AI-defensive cost pressure, not a collapse. FCF \$10.3B TTM gives P/FCF 7.8x; TTM P/E 11x, forward P/E 8.3x on FY2026 consensus \$24.43 — consistent with generator's 9-11x claim. Net debt \$2.2B vs \$10.3B FCF (0.2x) is manageable; \$9-11B annual buybacks reducing share count ~6%/yr confirmed. \$1B FY2024 charge was Figma termination fee (one-time, verified). No accounting anomalies; ~95% subscription revenue confirmed. PFIC N/A (US domestic issuer). No phantom ticker — ADBG/ADBU are separate leveraged products. Key risk (AI commoditization eroding creative-seat growth and pricing) is real and showing up in cost structure, but top-line growth has not broken. At 8x forward earnings on a still-growing, high-FCF franchise, the risk/reward is defensible as OWNABLE. Primary monitoring flag: whether Q2 margin compression is structural (33.8%) or temporary — if margins settle below 34%, the terminal-value math deteriorates faster than the generator implies.

CTSH — IT services (US) · SignalOS: OWNABLE · durable=True · PFIC=na

Bull case (SignalOS): Net-cash IT-services compounder cut 53% YTD to ~8.6x P/E / 3.2% yield on secular AI fear, while primary data through Q1'26 shows durable, high-quality earnings (FY25 CFO \$2.88B > NI \$2.23B, op margin rising to 16%, revenue reaccelerating to \$21.1B) — an overdone derating, not an accounting or balance-sheet break. **Key risk (SignalOS):** Secular agentic/gen-AI compression of the headcount-linked labor-arbitrage services model — the force driving the 52% derating that the financials don't yet show; FY25 growth is largely inorganic (Belcan), so organic demand erosion would confirm the trap. **Skeptic (PASS):** All primary XBRL metrics independently confirmed: FY25 revenue \$21.1B, NI \$2.23B, CFO \$2.88B (CFO/NI=1.29x quality), op margin 16.1%, EPS \$4.56 diluted, P/E 8.58x at \$39.15, yield 3.2%, net cash +\$936M (cash \$1,504M vs LT debt \$535M + ST \$33M). Q1'26 revenue \$5,413M = +5.8% YoY — still growing, margins stable. PFIC N/A (US domestic operating corp). No phantom share class. One generator error caught: "largely inorganic Belcan" is wrong for FY25 — Belcan (acquired Aug 2023) was fully in FY24 base, so FY25 +7% vs FY24 is organic; this strengthens the bull case. New \$730M Q1'26 acquisition is a separate deal. Secular AI risk correctly identified and disclosed; not yet visible in financials through Q1'26. Ownable at 8.6x GAAP P/E with net-cash balance sheet and durable high-quality earnings.

EPAM — IT services (US) · SignalOS: OWNABLE · durable=True · PFIC=na

Bull case (SignalOS): Honesty-clean 62% de-rate to ~9x forward GAAP EPS on a net-cash, still-growing IT-services franchise (FY26 GAAP EPS guided +23-28%, Q1 GAAP EPS +18.8%, \$324M buyback at lows) — the crash is a multiple compression on a forward AI fear, not an earnings or accounting impairment, ideal to harvest and re-size. **Key risk (SignalOS):** Secular Gen-AI disruption of the billable-hours labor-arbitrage custom-engineering model could erode multi-year growth (organic cc already only ~3.7%) — the forward thesis the price is discounting, even though it is absent from current GAAP results. **Skeptic (PASS):** All key generator claims independently verified from SEC XBRL (CIK 0001352010) and Q1 2026 8-K/10-Q. Net cash \$1.037B (~25% of market cap), zero long-term debt since 2015, equity \$3.431B: solvency confirmed. Q1 2026 GAAP EPS \$1.52 vs \$1.28 = +18.8% confirmed. FY2026 GAAP EPS guidance \$8.29-\$8.59 (+23.4-27.8% vs FY2025 \$6.72) confirmed. \$324M Q1 buyback including \$300M ASR confirmed. Forward GAAP P/E 9.2x at \$77.37. PFIC N/A: Delaware corp, SIC 7371 IT services. Single share class, no phantom tickers. H2

EPS ramp is mechanically credible (ASR share reduction + seasonal SBC front-loading in Q1-Q2). The secular Gen-AI disruption risk is real — organic CC growth only 2.5-5.0% guided and headcount flat — but the generator explicitly names this as the key risk and it is priced at ~9x GAAP with 25% net-cash cushion. No over-claim found that warrants rejection.

PAYC — HCM software (US) · SignalOS: OWNABLE · durable=True · PFIC=na

Bull case (SignalOS): De-rated quality payroll-SaaS: net cash, 27% op margins, OCF \$679M (+27%), buying back stock, now ~10x OCF / 15x EPS after a ~50% drawdown; cannibalization was self-disclosed (clean), not an accounting trap. **Key risk (SignalOS):** Secular growth deceleration (30%→9%) from self-cannibalizing automation plus Paychex-Paycor/Rippling/Deel competition could push growth to mid-single-digits and compress the multiple further; FY24's peak 34% op margin won't repeat. **Skeptic (PASS):** All core financial claims independently verified via XBRL (CIK 0001590955). FY2025 OCF \$678.9M (+27.2% YoY) confirmed. Operating margin 27.6% confirmed (FY2024 peak 33.7%). At \$124.48 with 54.8M shares: P/OCF 10.0x and P/E 15.4x on FY2025 \$8.08 EPS confirmed. Corporate net cash confirmed (\$370M cash, minimal corporate debt; \$7.6B balance sheet is mostly matched client-float). Buybacks confirmed (\$325.5M FY2025, shares declining). PFIC N/A — US domestic Delaware corp. No ticker artifact. Solvency confirmed. FY2024 NI was anomalously elevated by an SBC credit reversal (-\$22.9M vs normal +\$118.7M); generator correctly uses FY2025 as normalized base. Revenue growth decelerating to 8.9% (FY2025) / 7.8% (Q1 2026) is real and disclosed, consistent with generator's stated key risk. No accounting trap, no blowup signal, no undisclosed liability. Verdict holds.

IT — IT research (US) · SignalOS: WAIT · durable=False · PFIC=na

Bull case (SignalOS): Quality FCF-generative research-subscription compounder de-rated ~69% on a real, honestly-disclosed inflection (federal-budget cuts + AI-driven seat trimming); balance sheet sound and not a liar, but revenue just turned negative YoY and net-expansion broke below 100% — harvest the loss, wait for wallet retention to re-stabilize before sizing meaningfully. **Key risk (SignalOS):** LLM/AI substitution structurally impairs the seat-based research model — Q1-26 wallet retention falling below 100% (GTS 97%, GBS 98%, vs 101%/105%) with stable logo retention is the first hard evidence existing clients are trimming spend; if secular rather than cyclical, the cheap ~9x EV/FCF multiple is a value trap that gets cheaper. **Skeptic (PASS):** Primary data confirms the generator's core signals. Wallet retention deteriorated from 101%/105% (GTS/GBS Q1 2025) to 97%/98% (Q1 2026) — the first sub-100% reading and the decisive signal the generator identified. Revenue is -1% on FX-neutral basis and full-year FY2026 guidance (\$6.405B+) implies a decline from FY2025 actual (\$6.5B), confirming "turned negative" on an organic basis. EV/FCF of ~8.5x is confirmed. PFIC N/A is correct (US domestic). One material overstatement: "balance sheet sound" is too generous — \$63M total equity against \$3.36B debt (D/E 52.93x) is highly leveraged; however, \$1.26B annual FCF against \$1.69B net debt keeps near-term solvency risk low, and the leverage reinforces rather than reverses the WAIT conclusion. Durable-earnings: false is confirmed (EPS growth is buyback-manufactured while EBITDA fell 9.8% YoY). No fraud, no PFIC, no wash-sale artifact. WAIT holds: the wallet retention deterioration is real and confirmed, the AI/secular-vs-cyclical

uncertainty is unresolved, and the stock is not ownable until wallet retention re-stabilizes above 100%.

ACN — Consulting (Ireland) · SignalOS: OWNABLE · durable=True · PFIC=yes

Bull case (SignalOS): Net-cash global services compounder de-rated ~28x to ~9x forward (5% yield) on an HONESTLY-disclosed bookings deceleration + ~1% US-federal drag; trailing earnings are real and still growing (Q3 FY26 EPS +9%, margins +20bps, FCF ~\$11B, EPS guide raised) — price discounts heavy GenAI-disruption fear, not an actual earnings break. For a harvest-and-re-own book the loss is bankable and the re-entry is a durable franchise at a deep-value multiple, not a value trap.

Key risk (SignalOS): Book-to-bill (~1.03x and falling; new bookings -3% local currency) breaking below 1.0 and staying there as GenAI deflates the labor-arbitrage/headcount-billing model — backlog then burns off into an FY27-28 revenue/EPS rollover that the current trailing numbers do not yet show. **Skeptic (PASS):** Independent XBRL + Q3 Exhibit 99 verification confirms the core thesis. Solvency: excellent (net cash \$10.06B, no long-term debt, 9-month operating CF \$9.27B). Earnings durable: Q3 FY26 GAAP EPS +9% (\$3.80 vs \$3.49), operating margins +20bps to 17.0%, no one-time tailwinds inflating Q3. FY26 GAAP EPS guided \$13.38-\$13.50 with lower bound raised (confirmed raise). FCF \$10.8-11.5B guided. Forward P/E 9.4x at \$125.82, dividend yield 5.2%, FCF yield 14.5% — all confirmed. PFIC: NOT a PFIC (Irish-incorporated but SIC 7389 active consulting, 100% active income, fails both PFIC tests by wide margin, no PFIC disclosure in 10-Q). No phantom share class — only Class A ordinary shares trade as ACN. Book-to-bill 1.032x with new bookings -3% local currency confirmed. Key generator omission: AFS DOJ civil+criminal False Claims Act investigation (voluntary disclosure, cooperating) was not in the generator's risk section; this is a real tail risk but voluntary disclosure + cooperation is the strongest mitigating posture and \$11B FCF provides settlement cushion. Additional positive not captured by generator: June 23, 2026 8-K increased FY26 buyback program to \$7.5B (+\$2B incremental, 62% YoY), with \$2.3B planned in Q4 alone at current prices — management signaling strong conviction the stock is mispriced. The harvest-and-re-own thesis holds at 9.4x forward earnings on a franchise with \$10B net cash and growing EPS/margins.

INFY — IT services (India) · SignalOS: OWNABLE · durable=True · PFIC=yes

Bull case (SignalOS): Fortress-balance-sheet (~\$4.6B cash/investments, debt-free), non-PFIC Indian IT compounder with durable, FCF-rich earnings (\$3.3B net profit, 20% margins) honestly disclosing decelerating growth; de-rated ~22x to ~13x / 4.9% yield over 12 months — a clean tax-loss harvest with real quality and solvency, not a fraud trap or blowup. **Key risk (SignalOS):** GenAI secular disruption of the labor-arbitrage services model: the persistent, still-falling 12-month de-rating (\$18.6 to \$10.8) prices structural growth erosion — if discretionary IT spend and pricing compress further, earnings stagnate and the low multiple persists (slow melt, not a V-recovery), so sizing meaningfully is catching a falling knife. **Skeptic (PASS):** All primary claims verified against FY2026 20-F (filed 2026-06-15, period ended 2026-03-31) and IBKR live data. Balance sheet: \$4,648M cash+investments (\$2,341M cash + \$1,365M current investments + \$942M non-current), zero outstanding borrowings — confirms generator's \$4.6B fortress and debt-free claim. Net profit: \$3,316M confirms \$3.3B claim. Operating margin 20.3% confirms generator's "20% margins" in IT-

services-standard operating-margin terms (net margin is 16.4%, minor framing imprecision not material). PFIC: 20-F explicitly says "We do not believe that we satisfy either of the tests for passive foreign investment company status for the year ended on March 31, 2026" — clean. Current P/E \$10.57/\$0.81 EPS = 13.0x, prior forward P/E ~22.9x, dividend yield 4.86% — all match generator. Revenue growth decelerating to +4.6% YoY (\$19.28B FY2025 → \$20.16B FY2026) validates the secular-disruption risk framing. INFY NYSE is the clean Infosys ADR with no phantom share-class issue. No fraud, blowup, or honesty red flags.

WIT — IT services (India) · SignalOS: OWNABLE · durable=True · PFIC=yes

Bull case (SignalOS): Solvent, net-cash, ~14%-margin global IT-services large-cap; FY26 20-F honestly discloses earnings are durable (~\$1.4B, flat-to-up) and non-PFIC, with a real tax-loss-harvest dislocation (-21% YTD) and no takeaway-vs-data divergence — a disclosed low-growth value name, not a trap. **Key risk (SignalOS):** Secular no-growth/melt: constant-currency IT-Services revenue fell 1.6% in FY26 (reported growth is rupee depreciation, not demand) and GenAI threatens the labor-arbitrage seat-based model — durable earnings but not durable growth, and a sub-peer-margin structural laggard to TCS/Infosys. **Skeptic (PASS):** All material generator claims independently confirmed from primary sources. FY2026 net income \$1,406.5M (~14.2% net margin) verified from Wipro press release and SEC 6-K. Constant-currency IT Services revenue -1.6% YoY confirmed verbatim from press release. Net-cash confirmed: ₹340B INR net (~\$3.6B USD) when including \$4.7B in liquid short-term investments (standard Indian IT treatment). PFIC: 20-F explicitly states Wipro does not believe it is a PFIC for FY2026 (active IT services >99% of revenue passes income test). ADR structure clean — WIT is a legitimate 1:1 NYSE-listed ADS with no phantom share class. Key risk (CC revenue decline, GenAI labor-arbitrage threat) is honestly disclosed in the thesis and confirmed by analyst "SELL" consensus. No takeaway-vs-data divergence. Verdict OWNABLE as a disclosed flat-earnings value name with real secular risk is accurate.

UHS — Healthcare (US) · SignalOS: OWNABLE · durable=True · PFIC=na

Bull case (SignalOS): Quality deleveraging dual-platform hospital operator at ~6x trailing EPS after a -41pct drawdown over-pricing a gradual, fully-disclosed Medicaid/ACA headwind; durable growing core, no accounting mirage. **Key risk (SignalOS):** Medicaid state-directed/supplemental-payment phase-down plus end-2025 ACA subsidy expiry compresses the supplemental-payment layer that drove the 2024-25 earnings surge; trailing 6x may be peak-earnings cheapness. **Skeptic (PASS):** Independently confirmed: solvency strong (debt/EBITDA 1.74x, interest coverage 10.2x); Q1 2026 EPS +17% YoY with 2026 guidance +8.5% growth contradicts peak-earnings thesis; trailing 6.3-6.7x PE confirmed; labor normalization (not supplemental-payment inflation) drove the 2024-25 surge, making core earnings more durable than feared; Medicaid headwind (Big Beautiful Bill) is real but 3-year delayed and 5-year phased, max loss ~\$400M of \$1.2B benefit with active mitigation underway; ACA headwind only \$75M and baked into maintained guidance; no PFIC, no share-class artifact, no accounting red flags.

MD — Healthcare (US) · SignalOS: OWNABLE · durable=True · PFIC=na

Bull case (SignalOS): Restructured hospital-based physician group (NICU/maternal-fetal): 2024 net loss was a disclosed non-cash \$150.6M goodwill impairment; 2025 swung to real \$208.8M operating income and \$271M operating cash flow on ~1x net leverage — durable cash-backed earnings at ~12x P/E, not a mirage; ownable but fairly valued after a ~2x run. **Key risk (SignalOS):** Secular US birth-rate decline, heavy Medicaid payor mix, and hospital-contract dependence cap growth at low-single-digit; the 2025 earnings recovery was a one-time portfolio/cost reset that cannot repeat, and the acquisition roll-up engine drove two prior goodwill impairments. **Skeptic (PASS):** Primary data confirms all material claims. 2025 operating income \$208.8M and OCF \$271.1M verified from 10-K FY2025. Net leverage confirmed at just under 1x (\$375M cash / ~\$220M net debt). Actual 2024 goodwill impairment was \$154.2M vs generator's \$150.6M — \$3.6M discrepancy is immaterial. P/E is ~11.1x (generator said ~12x — actually cheaper than stated, not an overstatement). Q1 2026 results (revenue +3.9% YoY, margin 8.7% vs 7.0%, EPS beat, \$280-300M EBITDA guidance reaffirmed) affirmatively refute the "one-time reset" risk: earnings are durable. Secular headwinds (birth rate, Medicaid mix, hospital contracts) are real and correctly disclosed in key_risk but carry no near-term blowup signature. No PFIC issue (US domestic operating company). Ownable verdict at ~11x P/E with cash-backed earnings and 1x leverage holds.

KBR — Gov services (US) · SignalOS: OWNABLE · durable=True · PFIC=na

Bull case (SignalOS): Cheap (~10x P/E, ~8x EV/EBIT, ~9% FCF yield), solvent gov-services + high-margin process-tech licensor sold off ~38% on DOGE/HomeSafe sentiment, not operating deterioration; operating income genuinely recovered and expanded (\$449M FY23 to \$778M FY25), so the tax-loss is harvestable into an ownable hold. **Key risk (SignalOS):** ~70% US-government revenue concentration exposed to DOGE/federal-budget cuts and big-program recompetes (LOGCAP), plus the impaired HomeSafe/GHC household-goods contract overhang. **Skeptic (PASS):** Independent verification confirms the core thesis: operating income genuinely recovered (\$449M FY2023 to \$659M FY2024 to \$778M FY2025 per SEC filings), forward P/E of 7.8-8.5x on reaffirmed FY2026 adj EPS guidance of \$3.87-\$4.22, EV/EBIT ~9x (generator said ~8x, minor overshoot), FCF \$482M FY2025, company solvent (equity \$1.5B, net debt \$2.3B), US-domiciled so PFIC N/A. Generator overstated US gov concentration (57% US, 9% UK, ~66% total, not 70%) and mischaracterized HomeSafe as "overhang" when the contract was actually terminated June 2025 — but KBR confirmed it was EBITDA-immaterial (program was unprofitable). Two unacknowledged risks: (1) securities class action (class period May-June 2025, pending) — manageable at this valuation; (2) tax-free MTS spin-off targeting Jan 4, 2027 — actually a value-unlocking catalyst. Q1 FY2026 showed revenue -5% and operating income -11% from expected EUCOM runoff, but adj EBITDA +1% and full-year guidance reaffirmed. LOGCAP V task orders secured through March 2027 reduce near-term recompetes risk. At 8x forward P/E the stock prices real risks without requiring perfect execution; OWNABLE verdict stands.

MMS — Gov services (US) · SignalOS: OWNABLE · durable=True · PFIC=na

Bull case (SignalOS): Profitable, deleveraging government-BPO at ~7x EPS, halved on a real-but-pre-priced DOGE/federal-cut overhang while still growing EPS and defending record margins; the FY24 earnings jump is recovery off a known FY23 cost trough, not a mirage, and H1-FY26 confirms it

holds. **Key risk (SignalOS):** ~40% federal revenue exposed to DOGE-era contract cuts/insourcing plus flagship CMS contact-center recompetes and the ending Medicaid-redetermination tailwind — revenue already turned -4% YoY in H1-FY26, so the current earnings LEVEL (not its quality) is what's at risk. **Skeptic (PASS):** Independently verified via Q2 FY2026 10-Q and press releases. Solvency confirmed: net leverage 1.75x, FCF guidance \$450-500M, no going concern, cash plus \$350M receivables facility. Earnings quality is durable: H1 FY2026 GAAP EPS \$3.50 vs \$2.35 prior year (+49%) driven by 240bps operating margin expansion (structural tech-efficiency gains, not one-time items); margin has expanded four consecutive quarters. Revenue decline of -4.1% in H1 FY2026 confirmed. Valuation confirmed at ~6.5-7x adjusted FY2026 EPS guidance of \$8.25-8.55 at current ~\$55 price. PFIC N/A confirmed (Virginia-incorporated, NYSE-listed domestic company). No phantom share class or wash-sale artifact. Two material discrepancies vs. generator, both direction-neutral to slightly favorable: (1) U.S. Federal revenue is ~57% of revenue, not ~40%, but DOGE real-dollar impact has been negligible (\$4M vs \$5.4B revenue) and CCO contract (25-30% of revenue) is secured through 2031; (2) the CMS contact-center recompetes listed as a key ongoing risk was actually RESOLVED in Maximus's favor in November 2024 — the recompetes was cancelled and the existing contract continues through 2031, making the actual risk profile modestly better than described. OWNABLE verdict affirmed on solvency, durable earnings, confirmed cheap valuation, and no unpriced blowup risk.

YUMC — Restaurants (US) · SignalOS: OWNABLE · durable=True · PFIC=na

Bull case (SignalOS): Dominant, debt-free, buyback-heavy China QSR (KFC/Pizza Hut) de-rated to ~15x at its 52-week low on China-macro/geopolitical sentiment while operating income (+11% FY, +12% Q1-26) and cash flow keep compounding — harvest the loss and re-own. **Key risk (SignalOS):** US-China geopolitical overhang (forced delisting/divestment tail) plus China-consumer softness pressuring same-store sales — a sentiment/macro de-rater, not an earnings-quality break; partly hedged by the Delaware/10-K structure and HK dual listing. **Skeptic (PASS):** All material generator claims independently verified from primary sources. FY2025 operating profit \$1.3B +11% and Q1-2026 \$447M +12% confirmed (8th consecutive quarter of margin expansion). Financial debt negligible (~\$30M); "debt-free" is accurate in financial-debt terms — \$1.87B in lease liabilities is standard QSR operating structure, not financial leverage. PFIC correctly N/A: YUMC is a Delaware domestic corporation filing a 10-K, not subject to PFIC rules. Live IBKR price \$40.18 is at the 52-week low (\$40.15), validating the de-rating narrative. Trailing P/E ~16x on FY2025 EPS of \$2.51. Key nuance: same-store sales were flat in Q1-2026 (system sales +4% ex-FX driven entirely by net new store openings), so China consumer softness risk is active — but the generator flags this explicitly. YUMC uses direct WFOE ownership (no VIE), making it structurally cleaner than most US-listed China names. No phantom tickers or wash-sale artifacts. Geopolitical/HFCAA risk is real but PCAOB inspection access was restored in 2022 and HK dual-listing provides an investor exit valve. Thesis holds.

SFM — Grocery (US) · SignalOS: OWNABLE · durable=True · PFIC=na

Bull case (SignalOS): Debt-free specialty grocer at record margins (op income +36% to \$686M FY25), ~15x after a 52% momentum-unwind de-rate — the crash is multiple compression off a \$171

peak, not fundamental impairment, so the tax loss is harvestable and the business is rebuyable. **Key risk (SignalOS):** Post-GLP-1 comp normalization is real and disclosed: Q1-2026 revenue only +4.1% YoY and net income -9% YoY (first earnings decline), so FY26 earnings track flat-to-down and the multiple can compress further toward a low-teens grocer multiple despite the pristine balance sheet. **Skeptic (PASS):** All generator claims independently verified against primary SEC filings and investor press releases. FY2025: operating income \$686.2M (+36% confirmed), net income \$523.7M, EPS \$5.31. Q1 2026: net sales +4.2% YoY (generator said +4.1%), net income \$163.7M vs \$180.0M = -9.0% exactly as stated. Current price ~\$82, trailing P/E 15.5x, stock down 52% from \$171.15 peak - all confirmed. FY2026 EBIT guidance \$675-\$695M on a 52-week basis (vs \$686M FY2025) confirms flat-to-down earnings trajectory. Minor imprecision: generator called the balance sheet "debt-free" but \$81.6M LT debt (likely finance lease obligations from new store openings) exists; however company is net-cash positive by ~\$175M with \$0 drawn on \$600M revolver, which is not materially misleading on solvency. PFIC: N/A (domestic US C-corp). No wash-sale artifacts (single share class real operating company). Competitive risk from Kroger price cuts and insider selling (\$3M, zero buying) are modest additional concerns not mentioned by generator, but neither is disqualifying given the explicit comp-normalization risk disclosure already in the key_risk section.

URBN — Retail (US) · SignalOS: OWNABLE · durable=True · PFIC=na

Bull case (SignalOS): Net-cash, debt-free multi-brand retailer (Anthropologie/Free People/Nuuly carrying a soft UO namesake) compounding revenue and margins for 5 straight years to all-time-high FY26 earnings — cash-backed, not a base-effect spike — at ~13x P/E, a defensible meaningful-size harvest-replacement. **Key risk (SignalOS):** Operating margin sits at an all-time peak (~9.8%) in a discretionary, China-sourcing/tariff-exposed apparel business; a consumer pullback or tariff cost shock could compress the operating leverage that drove the re-rating (amplified by ongoing UO namesake-brand softness). **Skeptic (PASS):** Independent verification confirms: (1) Debt-free with \$1.16B cash+marketable securities vs zero financial debt (\$1.2B in aggregator "total debt" is entirely ASC-842 operating lease liabilities, industry-standard "debt-free" treatment); (2) Durable earnings — five consecutive years of revenue/net income growth confirmed in XBRL data, Q1 FY2027 (ended Apr 30 2026) delivered record sales/EPS beating estimates, ruling out one-time spike; (3) Operating margin 9.77-9.82% FY25-26, near all-time highs (generator's "~9.8% peak" is accurate); (4) Actual trailing P/E ~14.1x not ~13x — minor 1-turn overstatement of cheapness, does not change OWNABLE character; (5) PFIC N/A (US domestic PA corporation); (6) URBN is single-class NASDAQ common stock, no phantom ticker artifact. Generator thesis holds; key risks (tariffs, UO brand softness, peak-margin reversal) are correctly identified and do not negate ownability at current valuation.

GNTX — Auto parts (US) · SignalOS: OWNABLE · durable=True · PFIC=na

Bull case (SignalOS): Debt-free ~90%-share auto-dimming-mirror franchise at ~14x P/E / ~8% FCF yield (live \$25.77), \$587M OCF fully covering earnings that NORMALIZED off the 2023 chip-recovery peak (not a fresh spike) — a clean harvest-and-hold, not a trap or blowup. **Key risk (SignalOS):** High-margin core erosion: the margin-dilutive VOXX consumer-electronics pivot (NI fell in 2025 despite revenue up) plus long-run camera/CMS displacement of interior mirrors compressing the

~34% gross margin and the multiple — a value/quality de-rate risk, not a solvency one. **Skeptic (PASS):** All primary claims confirmed via XBRL/IBKR: zero long-term debt (solvency clean), FY2025 P/E 14.4x at \$25.77, OCF \$587M (10.6% yield / ~8% FCF yield after est. capex), gross margin 34.2%, \$145.6M net cash. NI declining 3-year trend (\$428M→\$404M→\$385M) is real margin compression from VOXX consumer-electronics drag while revenue grows (+9.6% FY25), not a one-time earnings spike unwinding — consistent with the generator's framing. Q1 2026 NI +3.8% YoY on revenue +17% suggests incipient stabilization. Camera/CMS secular displacement risk is real but a long-duration (5-10+ yr) risk, not a near-term blowup. PFIC N/A (US domestic Michigan corp). Single share class, no wash-sale artifacts.

VNT — Industrial (US) · SignalOS: OWNABLE · durable=True · PFIC=na

Bull case (SignalOS): Global fuel-dispensing leader (Gilbarco Veeder-Root) at ~10.6x earnings / ~10% FCF yield with stable ~18% op margins, shares down 15% since spin via buybacks, and active deleveraging; the ~37% drawdown is EV-terminal-value multiple compression, not earnings erosion (Q1-26 net income +7% YoY) — a harvest-and-rebuy candidate, not a trap. **Key risk (SignalOS):** Secular EV-transition decline of the fuel-dispenser installed base is a genuine terminal-value overhang that can keep the multiple structurally compressed (and threatens the \$1.76B goodwill, which exceeds book equity) even while near-term earnings and FCF hold up. **Skeptic (PASS):** Primary data confirms the generator's core claims: P/E 10.45x (generator ~10.6x), TTM FCF yield ~9% on \$373M/\$4.17B (generator ~10%, modestly overstated but FY2025 FCF of \$441M supports the ~10% frame), stable 18.4% operating margins, Q1-26 net income +7.3% YoY, net leverage 2.4x EBITDA, interest coverage 9x — solvency acceptable. PFIC N/A confirmed (Delaware incorporation). No phantom share class (single-class NYSE). Goodwill \$1.76B exceeding book equity \$1.26B correctly flagged. One gap: generator omits the Q2-26 Teletrac divestiture GAAP loss (\$60-110M one-time) which will depress reported Q2 earnings but is non-recurring and consistent with the deleveraging thesis. Share count reduction since spin is ~16%, slightly above the stated 15%. Secular EV terminal-value risk is real, long-dated, and correctly labeled as the load-bearing uncertainty; near-term Gilbarco dispenser demand remains strong. None of the gaps overturn OWNABLE at ~10x earnings with stable cash generation.

MGY — Energy E&P (US) · SignalOS: OWNABLE · durable=True · PFIC=na

Bull case (SignalOS): Low-leverage South Texas E&P (Karnes base + Giddings growth) with resilient through-cycle operating cash flow (~\$856M/\$921M/\$879M for 2023-25) and ~0.3x net-debt/EBITDA; the 2022 commodity peak is fully normalized out, so no base-effect mirage — a clean, solvent capital-returner. **Key risk (SignalOS):** Earnings are oil/gas-realization-linked and undiversifiable — a sustained crude/gas downdraft compresses OCF, dividends and buyback capacity (plus Giddings well-productivity execution risk); low leverage rules out a blowup but not a commodity-driven earnings/price drawdown, and entry at ~\$27 is near 52w highs, not distressed. **Skeptic (PASS):** All material claims verified from primary XBRL (CIK 0001698990). OCF 2023-25 matches exactly (\$855.8M/\$920.9M/\$878.6M). Net debt/EBITDA is 0.14x at YE2025 (generator overstated at 0.3x, a conservative error). Debt is \$400M fixed bullet notes with no near-term maturity pressure. PFIC N/A (Delaware domestic, SIC 1311). Only MGY Class A trades; Class B NCI is down to 3% of equity and

shrinking — no phantom-ticker or wash-sale artifact. Earnings are structurally durable (stable OCF through commodity normalization, not a 2022 peak artifact). No blowup risk. Generator's one factual error — "near 52w highs at \$27" is wrong (actual 52w high \$32.73, entry is 17% below) — makes the risk case overstated, not understated. EV/EBITDA 6.0x and EV/OCF 6.0x at current \$27.20 price are defensible for a low-leverage domestic E&P with durable cash generation.

PARR — Refining (US) · SignalOS: OWNABLE · durable=False · PFIC=na

Bull case (SignalOS): Real, solvent, de-levering US refiner (~1x net debt/EBITDA, equity \$1.5B, buying back stock, captive Hawaii market) at a non-extended mid-cycle ~7.6x P/E — ownable for the cycle, but earnings are cyclical not durable, so size it as a cyclical, not a compounder. **Key risk (SignalOS):** Crack-spread mean reversion / refining downturn — NI swung +\$729M (2023) to -\$33M (2024) to +\$369M (2025); the cheap trailing multiple is the cyclical norm, not margin of safety, and the stock has already 2x'd off its lows. **Skeptic (PASS):** All material generator claims independently verified via SEC filings and IBKR live data. (1) Solvency confirmed: Q1 2026 equity \$1.52B, gross term debt \$638M, cash \$172.5M, no impairment charges, ABL facility upsized to \$1.4B in 2024. (2) Earnings cyclical confirmed and accurately characterized: NI \$728.6M (2023, but includes \$126M one-time deferred tax benefit; adjusted \$501M), -\$33.3M (2024), +\$369.4M (2025). Generator omits the tax benefit but the cyclical framing is still correct. (3) Net debt/EBITDA: ~0.7-1.2x depending on which debt figure used; generator's "~1x" is fair. (4) Live price \$54.13; 52-week low \$26.49 → 2.04x off lows (generator claim confirmed). (5) Trailing P/E ~7.3x on FY2025 EPS; generator's 7.6x within rounding of share-count changes from buybacks. (6) PFIC: N/A, Delaware US domestic corp, correctly flagged. (7) Single share class on NYSE, no phantom ticker artifacts. (8) Hawaii captive market moat is real. Key risk of crack-spread mean reversion is correctly the load-bearing caveat. Minor omission: Hawaii renewable diesel JV (commissioning Q4 2025) adds execution risk not flagged, but scale is modest vs. enterprise. OWNABLE as a sized cyclical position is defensible.

ALV — Auto safety (Sweden) · SignalOS: OWNABLE · durable=True · PFIC=na

Bull case (SignalOS): Oligopoly auto-safety leader at ~12x record-and-rising EPS (\$9.55 FY25) with expanding margins and ~1.2x net leverage; the loss is a cyclical drawdown, not a melting business — ownable to re-establish. **Key risk (SignalOS):** Record 2025 operating margins (~10%) are exposed to a global light-vehicle-production downturn and tariff/raw-material cost squeeze; cyclical margin mean-reversion, not solvency or fraud, is the swing factor. **Skeptic (PASS):** All primary metrics confirmed via XBRL (CIK 1034670). FY2025 EPS \$9.55 exact match; operating margin 10.06%; net leverage ~1.0-1.2x EBITDA depending on lease inclusion; OCF \$1,157M / interest \$103M = 11x covered; equity \$2,572M; no goodwill impairment or restructuring charges — FY25 earnings are clean. PFIC correctly N/A (Delaware-incorporated US domestic registrant filing 10-K). No phantom share class. Stated key risk (cyclical margin compression) is already visible in Q1 2026 data (op margin 8.6% vs 9.8% prior-year quarter) and is explicitly disclosed by the generator. No solvency, fraud, or secular-disruption concerns identified. Thesis — oligopoly leader at 12.7x trailing clean EPS through a production-cycle trough — is internally consistent and supported by primary data.

DRD — Gold mining (South Africa) · SignalOS: OWNABLE · durable=True · PFIC=yes

Bull case (SignalOS): Debt-free, net-cash SA surface-tailings gold retreater (Sibanye 50.1%); FY25 record earnings (NI ZAR2.24bn, OCF ZAR3.51bn>NI) are real and cash-backed, not a mirage; own 20-F confirms non-PFIC — ownable, but a cyclical leveraged bet on the rand gold price. **Key risk (SignalOS):** FY25's +69% earnings spike is pure rand-gold-price margin expansion on flat volume at a cyclical peak — high operating leverage means a gold correction compresses earnings fast, and the ADR's -30% YTD-2026 drop signals that reversal may already be underway. **Skeptic (PASS):** All primary claims independently verified from the actual FY2025 20-F (filed October 30, 2025) and H1 2026 6-K. Debt-free confirmed: "At June 30, 2025 and September 30, 2025, we had no external sources of capital" (undrawn R500M Nedbank GBF). Net-cash R1.3B at FY2025, risen to R1.7B by H1 2026. PFIC: 20-F states "We believe that we were not a PFIC for the prior taxable year" — with cash ~12% of total assets and 100% active gold mining income, structural PFIC risk is low. FY2025 headline earnings R2.24B (+69% YoY), OCF reconstructed at ~R3.47B > NI, consistent with generator's R3.51B claim. Earnings gain is purely operational margin expansion on 31% higher rand and gold price with flat volume — fully recurring in character (no non-cash or one-time inflators). Sibanye 50.1% confirmed verbatim. Single share class, no phantom tickers, no dual-class structure. H1 2026 results (EPS +98%, revenue +33%, cash to R1.7B) show momentum continued rather than reversed. The generator's "-30% YTD-2026" claim was temporally stale — DRD is roughly flat YTD as of late June 2026 with gold +27% YTD — but this inaccuracy does not alter the OWNABLE verdict; it actually strengthens it. Cyclical downside risk from a gold price reversal is real and the generator correctly flags it as the load-bearing risk, but all solvency, earnings-quality, and PFIC checks pass.

SFD — Packaged food (US) · SignalOS: WAIT · durable=False · PFIC=na

Bull case (SignalOS): Smithfield is a real, solvent, lowly-levered (net debt/EBITDA ~0.3x, \$1.5B cash) #1-US-pork player at ~10x EPS with a ~2x-covered ~5% yield — but FY24-25 earnings (\$987M NI) sit near a cyclical peak (FY23 was a -\$56M operating loss), and the Jan-2025 re-IPO left only ~7% public float under ~90% WH Group control, so a meaningful position is the wrong risk at mid-range; clean (not a trap), just not a size-up here. **Key risk (SignalOS):** Cyclical-peak earnings (10x is 10x peak; hog-cycle turn on feed-cost inflation/hog-price decline compresses EPS toward the FY23 trough) compounded by ~7% float under WH Group ~90% control — governance, related-party, and exit-liquidity overhang on any meaningful slug. **Skeptic (PASS):** All primary facts independently verified. FY2025: \$1,539M cash, net debt/adj. EBITDA 0.28x, EPS \$2.51 at 9.9x P/E (~\$24.94), \$1.25 annualized dividend at 5.0% yield with 2.01x EPS coverage. FY2023 operating loss of -\$56M confirmed (cyclical trough); Hog Production swung -\$144M to +\$176M in one year — durable_earnings: false is correct. WH Group owns ~88% (not 90% as stated) and public float is ~12% (not 7%; generator overstated the governance risk slightly but controlled-company classification is real). PFIC n/a confirmed: US domestic corporation, files 10-Ks. Solvency is clean. Q1 2026 is record Q1 and FY2026 guidance is flat-to-modestly-higher, so no imminent earnings cliff, but 10x on historically-volatile cycle earnings with an illiquid float and WH Group governance overhang warrants WAIT, not a buy. Generator thesis holds.
